Introduction

Welcome to **CareMetric Breathe** — the single platform that runs a CPAP/DME resupply department end to end: the patient storefront, the customer database, billing and the revenue cycle, clinical therapy monitoring, and all the documentation in between. This manual is your guide to using it.

Platform vs. tenant. CareMetric Breathe is the software platform — every practice that runs on it is a separate **tenant** with its own brand, web address, phone numbers, patients, and billing. A new tenant starts with CareMetric branding and makes it their own from System Configuration; **Penn Home Medical Supply** is simply one example of a tenant operating on the platform. The screenshots in this manual come from the CareMetric demo environment, so they show the platform's own branding — your live console shows whatever brand you configure.

Getting your workspace — self-serve sign-up

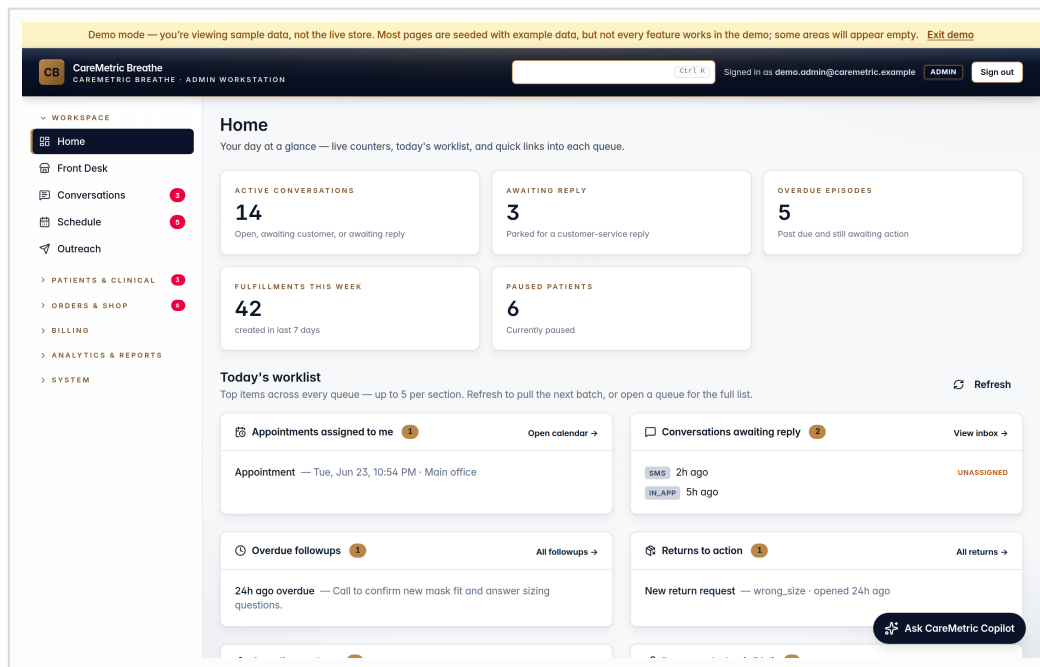

A new practice creates its own workspace from the public CareMetric Breathe site: open **/breathe** and choose **Create your account (/breathe/signup)**. Enter your company name, a work email, a password (at least 12 characters), and pick a plan — Virtual Mask Fitter, Launch, Growth, or Scale; Enterprise is custom-quoted, so it routes to a sales conversation rather than self-signup. Submitting provisions your organization, copies in the feature-flag bundle for your plan, and creates your first **Owner** login.

For security the account starts unverified: we email a verification link to the address you entered. Click it to activate the account, then sign in to your new workspace at **/admin/sign-in** — you confirm payment as you finish setting up. From there the Owner invites the rest of the team from the **Team** page (no one else needs to self-sign-up). Operators can still pre-provision a workspace from the command line, but self-serve sign-up is the normal path.

Create your account on the public CareMetric Breathe site — company, work email, password, and a plan spin up your workspace and first Owner login.

Signing in

Staff sign in at **/admin/sign-in** with the email your administrator invited and a password you set from the invite link. Forgot it? Use **/admin/forgot-password**; a link to verify a new email address arrives the same way. To protect against account enumeration, these pages always confirm “check your email” whether or not the address was on file. Every admin should enroll multi-factor authentication under **System** → **Account Security**. After signing in you land on the **Home** dashboard.

The Home dashboard: today's worklist, live counters, and the left-hand navigation grouped by area.

The four roles

Every staff account has a role that decides what they can see and do. This manual is organised around the four operating roles of a DME practice:

Administrator	Owner/admin of the practice — setup, team, controls, integrations, and full oversight of every area. The Owner is the top tier (team management + system secrets); Admin is broad management below that.
Billor	Revenue-cycle staff — the entire Billing area (eligibility, claims, A/R, ERA, clearinghouse) plus patient billing context.
Customer Service Rep	Front-line patient service — the inbox, scheduling, patients, fit requests, orders, and outreach.
Respiratory Therapist	Clinical staff — therapy monitoring, clinical documentation, interventions, and provider-ready reports.

Access is enforced everywhere: if a page is above your role, its link simply doesn't appear in your navigation. An Administrator assigns roles on the **Team** page — see the appendix for a role/permission matrix.

Getting help inside the app

Two AI assistants are built in. **CareMetric Copilot** (the admin assistant; “PennPilot” for the Penn tenant) floats on every admin page — ask it how a feature works or where to find a page and it answers with clickable links. **CareMetric Assistant** (the storefront chatbot; “PennBot” for the Penn tenant) answers patients on the storefront and can hand off to a CSR. Both are tenant-renamable and can be toggled in the Control Center.

What Sets CareMetric Breathe Apart

Most DME operations run on a patchwork: a billing system here, a resupply vendor there, an e-ordering tool, and spreadsheets between them. CareMetric Breathe replaces the patchwork with one AI-native platform built specifically for CPAP/PAP resupply — so the handoffs that used to mean re-keying, portal-hopping, and phone tag simply disappear. These are the capabilities that set it apart.

Capabilities a spreadsheet stack can't match

AI mask fitting, no appointment	Staff send a patient an invite link by text or email; the patient's phone camera measures their face right in the browser and scores every available mask for fit. Images never leave the device — only numeric measurements are sent — and none of the leading DME platforms offer anything like it. The completed fitting attaches itself to the right chart. Fewer fitting appointments, fewer wrong-size exchanges.
A voice agent that takes reorders	Patients call and a natural AI voice confirms identity, takes the resupply order, and writes a structured summary with sentiment and clinical flags — 24/7, with no hold queue. It hands off to a human the moment the caller asks.
Resupply that runs itself	Device-reported usage and payer replacement schedules trigger SMS and email reminders with signed one-tap confirm links; confirmed orders flow straight to fulfillment and billing. The reorder cycle turns without a CSR dialing a phone.
Eligibility and claims that work ahead of you	Real-time 270/271 eligibility runs on a schedule and again right before a claim goes out; claims arrive pre-scrubbed; the AI flags the fix before submission. Billers stop chasing avoidable rejections.
Denial recovery ranked by dollars	When a denial does land, the worklist ranks every one by recoverable value weighted by win-probability, and the AI denial analyzer reads the CARC/RARC codes, explains the root cause, drafts the fix or appeal, and — when it is safe — offers a one-click resubmit.
Every channel, one inbox	SMS, MMS, email, chat, and AI call summaries land in a single triage queue with assignment, priorities, and consent and quiet-hours enforced automatically. One inbox replaces five tools.
Therapy data from all three clouds, one PAP department	Nightly sync from ResMed AirView, Philips Care Orchestrator, and 3B React Health drives CMS 90-day compliance tracking, clinical worklists, and resupply timing — and it lives in the SAME system as the storefront, the customer database, billing, and documentation. No swivel-chair between systems, no per-module pricing, no integration projects.

The patient storefront — one front door for fitting, shopping, and resupply, with the AI assistant one tap away.

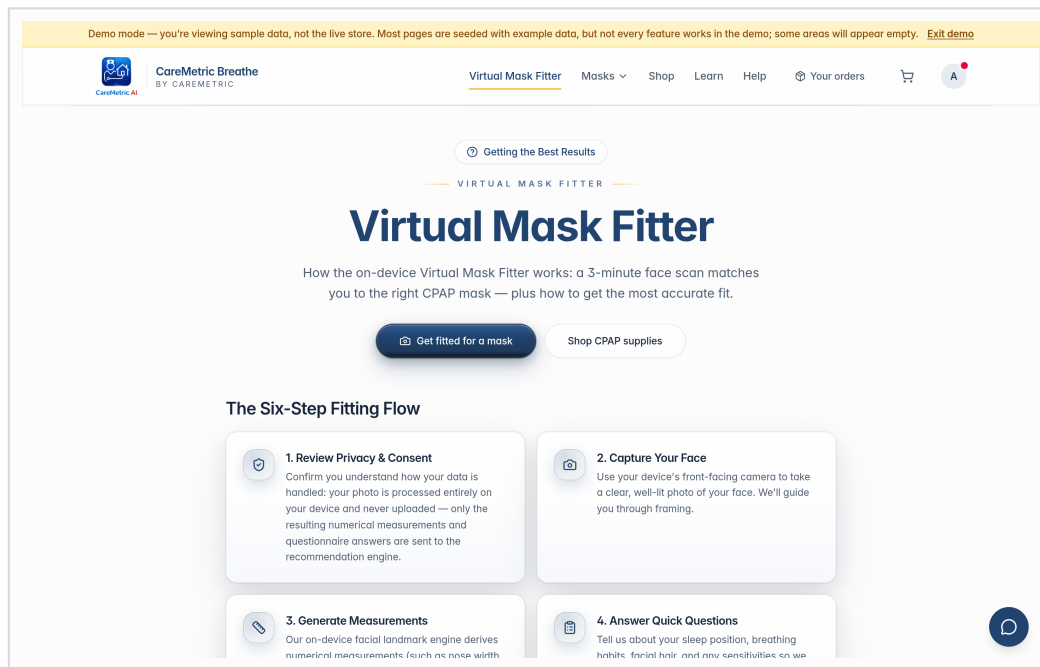

The platform underneath every role

Beneath the four role workspaces sits a shared platform layer. These capabilities serve patients directly or protect the business as a whole, and every role benefits from them.

Patient storefront & portal	A patient-facing site and self-service account portal: what they are due for, order tracking, statements and billing history, document access and e-signature, insurance details, caregiver access, and an in-app message thread with your team. It is an insurance storefront, not a retail one — patients are supplied against their plan and are never charged a card, so there is no cart and no checkout.
AI mask fitter	Camera-based facial measurement in the patient's browser scores every available mask for fit. Images never leave the device — only numeric measurements are transmitted. The fitter is invitation-only : staff send a signed invite link by SMS or email from Orders & Shop → Fitter Invites , and the completed fitting attaches back to the patient's chart.
Resupply reminder engine	Automated SMS and email reminders with signed one-tap confirm/decline links, quiet-hours awareness, and unsubscribe handling.
AI voice agent	A natural-voice phone agent that takes reorders, runs reminder and check-in calls, hands off to staff on request, and writes a structured summary of every call.
Chatbot & sleep coach	Patient-facing AI chat for shopping help and therapy coaching, with optional high-confidence email auto-reply; anything uncertain hands off to staff.
CareMetric Copilot (admin assistant)	An in-app AI helper on every admin page that answers “how do I” questions about the console and forwards staff feature ideas to ownership — always confirming before anything is sent.
Security & privacy	Hardened sign-in with optional MFA, role-based access with granular permissions, CSRF and rate-limit protection, and strict PHI discipline: camera images and order payloads are never logged.
Always-on by design	Feature flags flip capabilities instantly, vendor outages degrade gracefully instead of taking the site down, and background jobs handle syncs, reminders, and campaigns around the clock.

The Storefront & End-to-End Fulfillment

Every tenant gets a complete, ready-to-sell storefront — not a brochure, a working e-commerce site that takes the patient from “which mask fits me?” all the way to a box on the doorstep, with the practice billing either the patient or their insurance. It's the same system that runs billing, clinical, and resupply, so an order never has to be re-keyed from one tool into another. Here's the whole journey, end to end.

The storefront walks a patient from mask fitting to a request your team works — one front door for fit and resupply.

The mask catalog — every mask the tenant carries. Fitting still ends in a request, not a cart.

1 • AI mask fitting, by invitation. The mask fitter is **invitation-only**: a staff member sends the patient a signed link by text or email from **Orders & Shop** → **Fitter Invites** (the public storefront's "get fitted" button routes to an invitation-required explainer, not the fitter). The patient opens the link, consents, the phone or laptop camera measures their face right in the browser, they answer a short comfort questionnaire (mouth-breather, side-sleeper, facial hair, glasses...), and the AI ranks the masks that fit best — each with an add-to-cart button. The camera images never leave the device; only numeric measurements are used. The completed fitting attaches itself to the matching chart (or waits in a holding area for staff to attach). No appointment, no guesswork, far fewer wrong-size exchanges.

2 • Shop and buy in minutes. From the catalog the patient browses masks, cushions, tubing, filters, and bundles — with reviews, machine compatibility, and search — adds to the cart, and checks out through secure Stripe-hosted payment (card data never touches the platform). They can buy once, or choose **Subscribe & Save** so supplies auto-ship on a cadence, or pick **in-store pickup** where it's offered.

3 • Or bill it to insurance. Patients who'd rather use their benefits request insurance billing instead of paying cash. That drops a benefit-verification request into a CSR worklist, where staff run a real-time **270/271 eligibility** check, confirm what's covered and the patient's share, and — when coverage is good — create the order and send a signed payment link for the patient to e-sign and pay any balance. Coverage is confirmed *before* anything ships, so claims don't bounce later.

4 • Pick, pack, and a label in a click. Paid, unshipped orders queue up in the Shipping console with the patient's address already filled in. Staff rate-shop USPS, UPS, and FedEx, create and print the carrier label, and the tracking number is written back onto the order and emailed to the patient automatically — or they can key in a tracking number by hand. Counter and walk-in orders print a receipt and label the same way.

5 • Delivered — with proof. When the box arrives, staff capture **Proof of Delivery** right on the order — a delivery photo and an optional signature name — and the order is marked delivered. The patient can follow the whole way with a public **order-tracking** page (order number + email, no login).

6 • Closing the loop. After delivery the patient gets a quick satisfaction (NPS) prompt and a one-tap mask-fit check — "great / leaking / uncomfortable." A problem answer routes straight to a CSR or therapist to fix the fit, and the patient is enrolled in the resupply engine so the next cushion, filter, and tube reorder cycle starts itself. The storefront sale becomes a recurring, self-renewing relationship.

The product catalog — SKUs you dispense and on-hand counts. A blank count means untracked, not zero.

Paperless Paperwork — Referrals, eFax & E-Signature

The paperwork around DME — referrals coming in, prescriptions and CMNs going out, signatures chased by fax — is where days disappear and claims stall waiting on a page that never came back. CareMetric Breathe turns that paper chase into a tracked, largely self-driving pipeline: AI reads an incoming referral and stages a ready-to-accept patient; any document goes out by eFax carrying a barcode that files itself the moment it returns signed; and every signature out with a provider is tracked until it comes home. Most of it is opt-in — turn each piece on per tenant in the Control Center.

The referral, read and ready in one pass

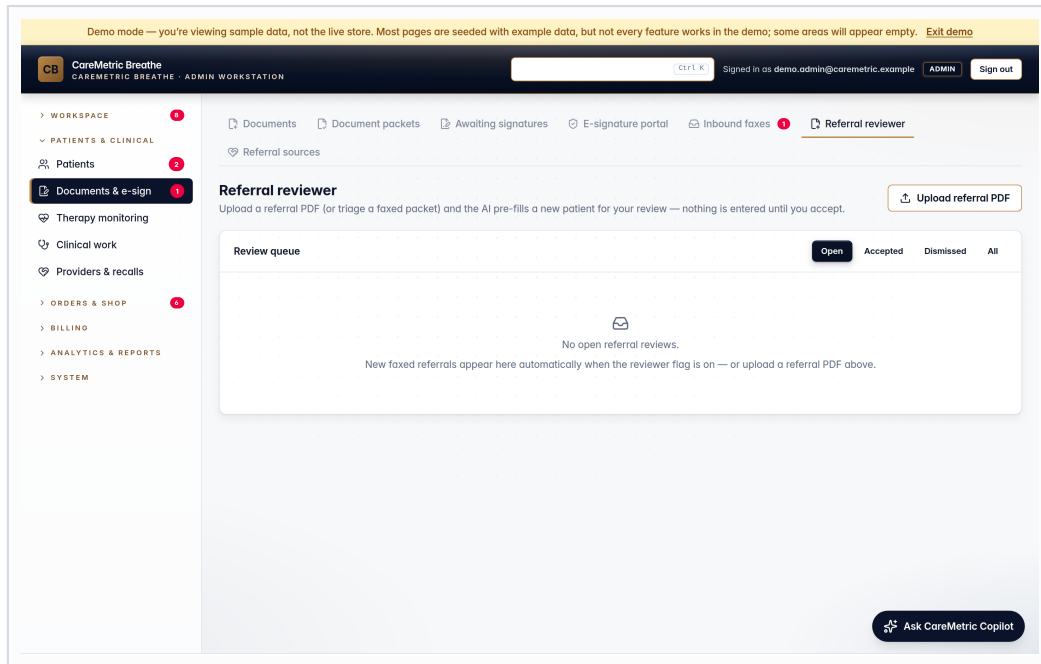

AI reads the whole packet. Upload a referral PDF — or let an inbound fax open one automatically — and the AI extracts the entire packet in a single pass: patient demographics, primary and secondary insurance, the ordered equipment with HCPCS codes, the sleep-study results, the referring physician (name, NPI, clinic, fax), and the diagnosis codes. Everything lands in an editable form beside the original page so you can check any field against the source.

It tells you what's missing. A completeness check flags exactly what a clean claim will need but the packet doesn't have — no signed physician order, a missing prescriber NPI, no face-to-face note, missing diagnosis codes, or a sleep study that doesn't qualify — so gaps surface at intake instead of at denial.

Verify coverage before you commit. One click runs a live 270/271 eligibility check on the extracted payer and member ID and shows active/inactive status, deductible and out-of-pocket remaining, and any prior-auth requirement — a coverage preview before the patient is ever created.

Accept once — patient, insurance, and chart, all at once. When it looks right, accept it: the system creates the new patient, saves the insurance coverages, splits the referral into named documents (sleep study, physician order, insurance card, chart notes...) filed straight to the chart, and generates a Referral Review summary. A duplicate-patient check warns you before you ever create a second record for someone already on file.

Send gaps back to the provider. If the referral is short something, one action drafts a letter to the referring office listing precisely what's needed; review it on the Documents page and fax it. Find it at **Patients & Clinical** → **Documents & e-sign** → **Referral reviewer**.

The Referral Reviewer — AI-extracted intake beside the original packet, with a completeness check and one-click insurance verification.

eFax with a barcode — send once, file itself

Fax anything, from right where you're working. Prescriptions, CMNs, orders, renewal requests, appeal letters — send any of them out by fax straight from the document, with no fax machine and no separate eFax login. The platform renders the PDF and dispatches it over its fax carrier; a failed fax can be retried in a click, and routine outreach (like a batch of renewal requests) can go automatically.

Every signature document carries a barcode. Any document you send out to be signed is stamped with a scannable barcode and a short tracking code, with plain-text filing instructions printed right on it. That barcode becomes the document's identity for the rest of its life.

It files itself when it comes back. When the signed copy is faxed back, the system reads the barcode off the page, matches it to the document it came from, copies the signed PDF into that patient's chart, marks the item returned and signed, and releases any bill-hold that was waiting on the paperwork — no manual filing and no “whose page is this?” Anything it can't match still lands in a triage queue for a human. (Automatic filing is an opt-in toggle; staff can also run it on demand.)

Never lose a signature again

One worklist for everything out for signature. The Awaiting Signatures dashboard lists every packet and document you've sent a provider to sign, who it went to, and how long it has been outstanding — so nothing vanishes into a fax-machine black hole. Scan or type a returned document's barcode to file it instantly; mark items returned, hand-delivered, or canceled; and re-send the ones that have gone quiet.

Or skip the fax entirely — providers e-sign online. Invite a referring provider (by NPI, verified against the national registry) into a secure, MFA-protected portal and stage their CMNs, orders, and packets for signature. They sign on their own device instead of printing and faxing back. Every signature is captured in a

tamper-evident, hash-chained audit trail with a printable, E-SIGN-compliant certificate you can hand a payer.

Demo mode — you're viewing sample data, not the live store. Most pages are seeded with example data, but not every feature works in the demo; some areas will appear empty. [Exit demo](#)

The Business Case — More Revenue, Less Labor

CareMetric Breathe earns its keep two ways at once: it collects more of the revenue you've already earned, and it does it with less staff time. The same automation that confirms reorders and scrubs claims also removes the manual work behind them — so the practice grows without growing headcount.

Where the new revenue comes from

More reorders confirmed	Automated reminders with one-tap confirm — and the AI voice agent for calls — lift the share of eligible patients who actually reorder on time, instead of supplies (and revenue) slipping.
More clean claims paid	AI scrubbing plus the pre-bill eligibility gate raise your first-pass acceptance rate, so more of what you bill is actually paid and less is written off.
Denials recovered, not lost	The AI denial analyzer fixes and resubmits denials ranked by recoverable dollars — recapturing money that would otherwise be abandoned.
Faster cash, lower DSO	Auto-submit and ERA auto-posting compress the claim-to-cash cycle, so the same revenue arrives sooner and working capital improves.
Coverage you didn't know about	Insurance Discovery finds active coverage from a patient's demographics — turning would-be self-pay or uncollected balances into billable claims.
Every billable cycle captured	Capped-rental month tracking and automatic secondary / COB drafting make sure no rental month or leftover balance is missed.
More new patients	The in-browser AI mask fitter and storefront convert visitors without an appointment, widening the top of the funnel.

The biller's job, transformed

Nowhere is the impact bigger than the biller's seat. The platform moves the work upstream — verify, scrub, prevent — and automates the cleanup, so a single biller can carry far more claims, cleanly.

Insurance verified before you bill. Coverage is confirmed by real-time 270/271 on a schedule and again in the seconds before a claim transmits. Inactive or prior-auth-required coverage is held back automatically — so claims don't bounce for eligibility and you stop billing into dead coverage.

Only clean claims go out. Every claim is scrubbed — structurally and by AI — before submission: wrong modifier for the rental month, quantity over the LCD limit, HCPCS/diagnosis mismatch, fee-schedule drift. Problems are flagged or fixed first, so your first-pass acceptance rate climbs and rejections fall.

Denials research and fix themselves. When a denial lands, the AI reads the CARC/RARC codes, researches the root cause, populates the corrective patch, and — when it's safe and high-confidence — resubmits in one click. The worklist is ranked by recoverable dollars, so the biggest recoveries happen first instead of claims aging into write-offs.

Paid faster, and audit-ready. Clean claims plus automatic payment posting mean cash arrives sooner (a lower DSO). And because required paperwork is enforced by bill hold, signed on file via e-signature, and every claim and signature carries a tamper-evident audit trail, you go into any payer audit far less exposed.

Ask CareMetric Copilot

Coverage is verified before billing and re-checked the moment before a claim goes out — claims stop bouncing for eligibility.

Hours back, every day — and what they cost

Because CareMetric Breathe is one platform — inventory, billing, the customer database, clinical care, and documentation together — the handoffs that used to mean re-keying, portal-hopping, and phone tag disappear. The estimates below are illustrative for a typical single-location PAP operation (about 1,500 active resupply patients; a team of one owner, one biller, two CSRs, and one respiratory therapist). Tune them to your own volumes.

Where the time goes — by feature

Feature	Replaces this manual work	Time saved
AI mask fitter	In-person fitting appointments and trial-and-error exchanges	15–30 min / new setup
Reminder engine + voice agent	Outbound reorder calls and voicemail loops	6–10 min / resupply order
Real-time eligibility	Payer phone calls and portal checks	10–15 min / verification
AI scrubbing + ranked denials	Hunting denial causes claim by claim	~15 min / denial worked
Therapy-cloud sync	Pulling three vendor portals for compliance data	~10 min / patient / month
Unified inbox + patient 360	Cross-referencing phone logs, email, fax, and billing	30–60 min / rep / day
Fax OCR + e-signature packets	Manual filing, printing, and signature chasing	5–10 min / document
PacWare sync	Re-keying patients and orders into the billing system	3–5 min / record

Rolled up by role

Role	What runs itself	Per day
Administrator (Owner)	Live dashboards and KPI alerts replace hand-built reports and spreadsheet checks	~45 min / day
Biller	Eligibility runs itself; claims arrive scrubbed and denials arrive ranked	~2.0 hrs / day
Customer Service Rep (each of 2)	Reorders confirm themselves by text, link, or the AI phone agent; one inbox replaces five tools	~2.5 hrs / day
Respiratory Therapist	Compliance data lands nightly and worklists build themselves	~1.5 hrs / day

~9.25 staff-hours back per day	~200 hours back per month	~\$5,000 per month (~\$60K/yr) at \$25/hr
--	-------------------------------------	---

And that is labor alone. Consolidating onto one platform also retires the rest of the stack — the business-management system, the resupply add-on, the e-ordering tool, and the spreadsheets between them — along with the subscriptions and integration upkeep they carry.

What it adds up to

The labor estimates below total roughly 200 staff-hours and about \$5,000 a month for a typical single-location practice. The revenue side compounds on top: even a few points of improvement on first-pass rate, denial recovery, and reorder confirmation — on the same patient base — adds materially more collected revenue every month. Together that is the return: more dollars in, fewer hours spent, on one platform.

Illustrative planning estimates, not a guarantee. Actual savings depend on patient volume, payer mix, and current workflows. Per-task figures reflect the manual workflows each feature replaces; the roll-up assumes the team mix above, 21.7 workdays per month, and a \$25/hour fully loaded labor rate ($9.25 \text{ hrs/day} \times 21.7 \text{ days} \approx 200 \text{ hrs}$; $200 \text{ hrs} \times \$25 \approx \$5,000/\text{month}$, $\approx \$60,000/\text{year}$).

CareMetric Copilot & the AI Assistants

Two AI assistants work alongside the business around the clock — one on the storefront answering patients, one inside the admin console guiding staff. Both are built in, both fall back gracefully (Claude first, then OpenAI, then a safe offline reply) if a vendor key is missing, and both are renamable per tenant — the Penn Home Medical Supply tenant calls them PennBot and PennPilot.

CareMetric Assistant — the patient's 24/7 answer

The storefront chatbot (PennBot for the Penn tenant) is the customer-facing assistant.

Answers patients 24/7. A chat assistant on the storefront answers questions about CPAP therapy, masks, resupply, insurance, and your company — instantly, day or night, with no hold queue and no callback. It is the front line for the routine questions that used to ring the phone.

Knows the patient's account. For a signed-in patient it is account-aware: it can pull recent shipments, order status and tracking, what they are due for next, and device details, and help with returns and account changes. So “where's my order?” and “when's my next refill?” answer themselves.

Knows when to hand off. Anything it can't resolve — order-specific, clinical, or an action that needs a person — it escalates to a CSR by opening a message thread, with the context attached. It never accepts sensitive data (SSN, card, member ID), it is not a clinician, and it gives no medical advice.

A sleep coach, too. In sleep-coach mode it offers supportive, plain-language coaching and troubleshooting for patients adjusting to therapy — the kind of reassurance that keeps new patients adherent.

The same brain by email. The optional email auto-reply uses the same knowledge base to answer inbound patient emails automatically — but only when it is highly confident. Anything below the confidence bar (or order/clinical-specific) falls through to a human, exactly like a hand-off in chat.

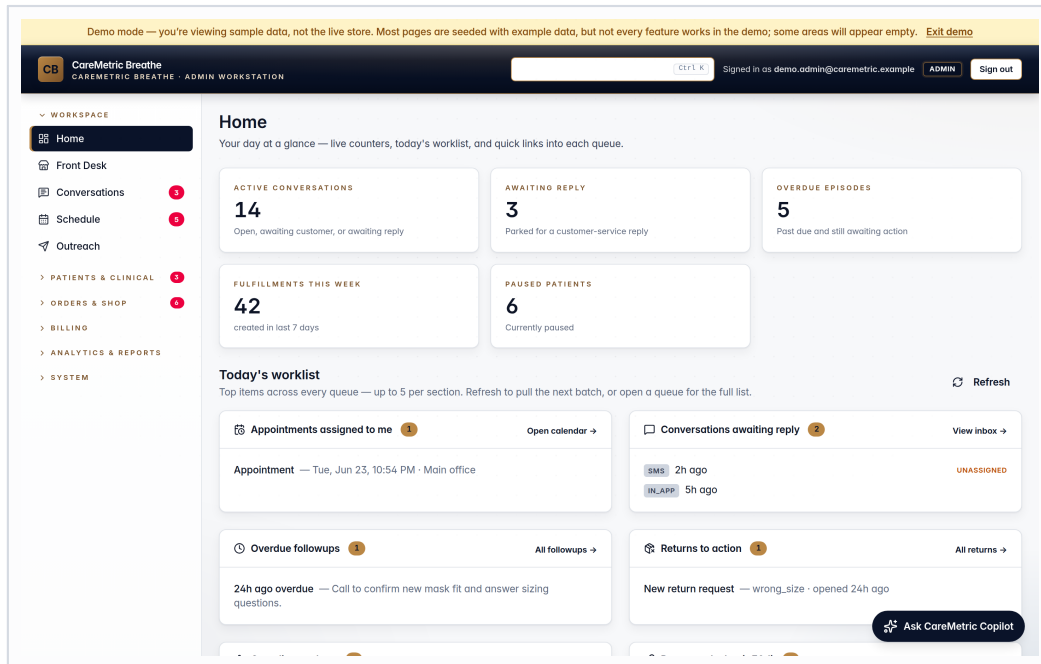

CareMetric Copilot — every employee's guide to the app

The in-app admin assistant (PennPilot for the Penn tenant) is the staff-facing helper, on every admin page.

Every employee's guide to the console. CareMetric Copilot floats on every admin page. Ask it “how does this work?” or “where's the page that does X?” and it answers from a complete map of the console and returns one-click links straight to the right screen. New hires get productive without interrupting a supervisor, and veterans find the rarely-used corner fast.

Walks staff through the work. Beyond finding pages, it explains workflows in plain language — “walk me through processing a claim,” “how do I turn a feature on?” — so the answer to a how-do-I question is a chat away instead of a training ticket.

Turns ideas into action — safely. Its one action, after the employee confirms, emails a structured feature suggestion to the owners. It takes no other actions: it never changes data, never sends anything silently, and never echoes patient PHI. It's an on/off toggle in the Control Center.

“Ask CareMetric Copilot” sits in the corner of every admin page — staff get an answer without leaving the work.

What a deflected call is worth

Every routine question a patient resolves in chat is a phone call your team never has to staff. An inbound call ties up a CSR for several minutes of handle time plus the queue around it; a chat the assistant answers costs essentially nothing and happens 24/7 — including the nights and weekends when no one is at the desk. Across a busy resupply line that is hours of phone time removed every week, shorter holds for the calls that do need a person, and patients who get an instant answer instead of waiting for a callback. The Copilot side compounds it: less time lost to “how do I...?” and faster onboarding for every new hire.

Tip *Illustrative: at a \$25/hour blended rate, a 6-minute call is about \$2.50 of labor. Deflecting even 20–30 routine questions a day to chat is roughly \$50–75/day — about \$1,000–1,500 a month — before counting the after-hours coverage you'd otherwise have to pay for. Directional planning figures, not a guarantee; tune to your call volume and rate.*

Running the Business — the Owner's Playbook

Running the practice from CareMetric Breathe is mostly a matter of knowing where to look and how often. Everything below is on one platform, so you monitor the whole business — front desk to clinic to revenue cycle — without logging into anything else. Set your targets once, let the alerts find the exceptions, and work from the queues.

What to watch, and when

Every day (5 minutes)

- **Home dashboard** — conversations awaiting reply, overdue follow-ups, returns to action, fulfillments this week.
- **Operations** — the background worker and nightly sync ran clean; nothing stuck.
- **Delivery Failures / Outbound Messages** — clear any bounced texts/emails or shipping exceptions.
- **KPI Alerts** — anything that crossed a threshold overnight (revenue dip, denial spike, churn).
- **Live Staffing** — open-conversation load per agent so nobody is buried.

Every week (20 minutes)

- **Billing Hub + Denials & DSO** — money in flight, denial rate, and days-to-pay trend per payer.
- **A/R Aging + Filing Deadlines** — work the oldest buckets and anything near timely-filing.
- **Therapy Fleet + Setup Adherence** — who is at risk of failing their CMS 90-day window.
- **Team Throughput** — per-agent close/approve/resolve counts.
- **Reorder Reminders funnel** — due → reminded → confirmed → shipped conversion.

Every month (45 minutes)

- **Financial analytics** — Margin & COGS, Payer Profitability, Revenue by Source, LTV:CAC, Inventory Turnover.
- **Reports** — export the revenue summary, patient payments, and insurance-claims reports (CSV / PDF / QuickBooks) for the books.
- **Goals & Targets** — review pace-to-goal and reset targets for the next period.
- **Customer NPS** — post-delivery satisfaction and the comment tail.
- **Package & Usage** — your plan, add-ons, and usage for the month.

Monitor every corner from one screen

Because it is one platform, you watch the whole business without leaving it. Where to look, by area:

Patients & service	Home, Conversations, Cases, Follow-ups, Live Staffing — every patient touch in one inbox with assignment and SLA visibility.
Revenue cycle	Billing Hub, Denials & DSO, A/R Aging, Collections Forecast, Payer Profitability — the whole money picture, claim to cash.
Clinical & therapy	RT Overview, Therapy Fleet, Setup Adherence — adherence and clinical risk across every device cloud.
Storefront & growth	Storefront Analytics, Acquisition Funnel, Reorder Reminders, Fitter Prospects — where patients come from and convert.
Operations & delivery	Operations, Integrations, Outbound Messages, Delivery Failures, Webhook Deliveries — the plumbing, at a glance.
Goals & exceptions	Goals & Targets and KPI Alerts — set the number you want; the platform flags the moment you drift from it.

Reports you can run

From **Analytics & Reports** → **Reports**, run any of these over a date range and export them:

Revenue summary	Per-day revenue, refunds, and net rollup.
Orders	Orders created in the date range.
Patient payments	Patient-responsibility amounts collected against a balance (deductible, coinsurance, non-covered items), kept separate from insurance receipts to avoid double-counting. Patients are not charged at a storefront checkout — this is what the billing team collects.
Insurance claims	Billing-side claims and payer receipts.
Refunds journal	A chronological refund ledger.
Returns	Comfort-guarantee returns and RMAs.
Customer activity	Aggregated storefront activity per day — signups, returning orders, active count (count-only, no PHI).
All-financial	One-click bundle: orders + refunds + payer receipts + patient payments, unioned chronologically.

Tip Every report exports as CSV, printable PDF, or QuickBooks (Desktop .iif and Online .qbo.csv). Date range defaults to the last 30 days (up to 90). PHI is minimized — storefront reports hash customer IDs and the customer-activity report is counts only.

Benchmarks — and staying ahead

CareMetric Breathe tracks the metrics a DME operation is judged on and lets you set a target for each, so you always know how you stack up. The “typical target” column lists commonly-cited industry rules of thumb —

directional, not a guarantee — and the right column is how the platform helps you beat them.

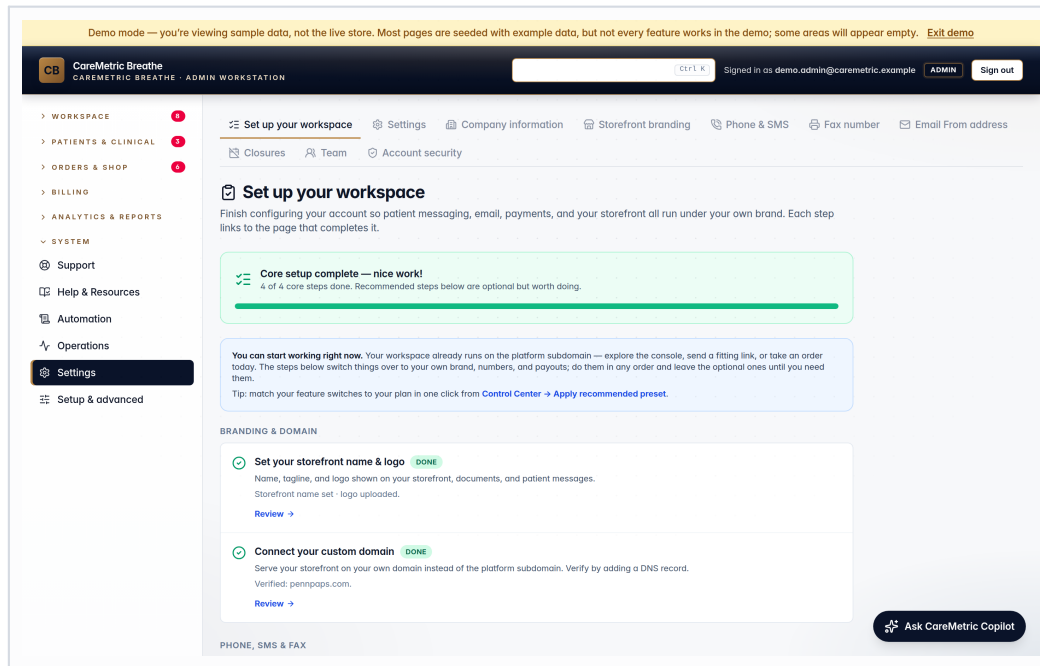

Metric	Typical target	How CareMetric Breathe keeps you ahead
Clean-claim / first-pass rate	≥ 95%	AI scrubbing + the pre-submit eligibility gate stop avoidable rejections before the 837P leaves.
Denial rate	< 5–10%	Denials & DSO benchmarking by payer plus the AI denial analyzer surface and fix the root cause fast.
Days sales outstanding (DSO)	< 30–40 days	Auto-submit, ERA auto-posting, and the recoverable-dollars denials worklist shorten claim-to-cash.
Resupply reorder rate	~30–40% of eligible	Automated reminders with one-tap confirm + the AI voice agent lift confirmations without staff dialing.
CMS 90-day adherence (new setups)	≥ 70% of nights ≥ 4 hrs	Setup Adherence tracks every new patient's rolling 30-day window and flags at-risk early for coaching.
Patient satisfaction (NPS)	Higher is better	Post-delivery NPS, fast omnichannel response, and the self-service portal keep scores up.

Target ranges are widely-cited DME/RCM rules of thumb for orientation only; they are not commitments and vary by payer mix and specialty. What the platform guarantees is the visibility and automation to measure and improve each one.

Setup Guide

Before your practice goes live, a handful of things must be configured so the platform runs under your own identity. Work the checklist below (the Home dashboard also shows a “finish setting up” banner until the essentials are done), then review the Control Center toggles so you know exactly what is on and off.

Before you go live

Set Up Your Workspace — the guided checklist that walks a new practice through the essentials.

Accounts & access

Create your workspace

Sign up at the public site (/breathe → Create your account): enter your company name, work email, a password (12+ characters), and a plan. That provisions your organization and your first Owner login; verify the emailed link, then sign in at /admin/sign-in. (Operators can also pre-provision a workspace from the command line, but self-serve sign-up is the normal path.)

Enroll multi-factor authentication

Each admin should add an authenticator app under System → Account Security before handling patient data.

Invite your team

Add staff on the Team page and give each the right role — Owner, Admin, CSR, Biller, or Respiratory Therapist — so they see only what they need.

Apply your plan's recommended preset

In the Control Center, one click sets your feature flags to the recommended bundle for your plan. New tenants already start on it; re-apply it after switching plans, then fine-tune individual flags.

Brand & identity

Company information	Enter your legal name, addresses, and identifiers — they print on documents, statements, and the storefront.
Storefront branding	Set the storefront name, tagline, logo, and theme. No logo yet? Generate a one-click starter monogram from your storefront name so nothing shows blank while you source artwork.
Custom domain	Point your domain at the platform so patients see your brand (the platform fronts custom domains through Cloudflare).

Communication channels

Phone & SMS numbers	You can start messaging immediately: until you provision your own number, texts and calls go out on a shared platform number, and a patient's reply is routed back to the tenant that owns them. Provision your own dedicated voice and SMS numbers (through the platform's carrier, Twilio/Telnyx — you don't supply or port a line) when you want messages to come from your own number, typically as volume grows. Set this under Phone & SMS.
Fax number	Faxes work on the shared platform number too; provision your own for inbound referrals and outbound signed paperwork when you're ready.
Email From address	The platform default sender works out of the box; to send from your own address, set it AND authenticate the sending domain (SPF/DKIM) in the email provider — an unauthenticated address still sends but lands in spam.

Money & integrations

Payments (Stripe)	Connect payment processing so the storefront and patient statements can collect; you confirm your subscription payment as you finish setup.
Clearinghouse & billing config	Enter Office Ally (and, if used, Da Vinci PAS) credentials under System Configuration, then set up payer profiles and fee schedules under Billing → Config before submitting claims.
Therapy-cloud integrations	Add ResMed AirView / Philips Care Orchestrator / 3B React Health credentials so adherence data flows into the RT boards.
Slack (optional)	To bring alerts and digests into Slack, add a Slack bot token + channel under System Configuration and link each teammate's Slack handle on the Team page; the Slack toggles ship on but stay inert until the credentials are set.

Tip Most of these live under **System** → **Settings** and **System** → **Setup & Advanced**. You can launch without the optional integrations — the platform degrades gracefully when a credential is unset; the matching feature simply stays idle.

Ready to bill on day one — the pre-loaded payers

You don't start with an empty payer table. CareMetric Breathe ships with **100+ fully-configured payer profiles** — the complete Pennsylvania DME market plus the national carriers, Medicare, Medicaid, federal, and workers'-comp / auto programs a PAP business actually bills. Each one arrives with the electronic IDs, claim format, timely-filing window, prior-auth rules, and claims address already filled in, so you can submit clean claims on day one instead of researching payer setup for weeks. Billing for a different state? Adding a payer takes a minute on the billing config page — the pre-loaded set is a head start, not a fence.

What's in the box

Pennsylvania Blues & major commercial	Highmark BCBS (Western & Central PA), Independence Blue Cross, Capital BlueCross, UPMC Health Plan, Geisinger Health Plan.
National commercial & employer TPAs	Aetna, Cigna, UnitedHealthcare, Humana, AmeriHealth, Ambetter, Oscar, Surest — plus self-funded administrators (Meritain, UMR, Allied, HealthSmart, Luminare, WebTPA, Imagine360, Nova, MagnaCare, EBMS, Independence Administrators).
Medicare (Part B, DME MAC, Railroad)	Novitas Solutions (PA Part B), Noridian (DME MAC Jurisdiction A), and Palmetto GBA Railroad Medicare.
Medicare Advantage & D-SNP	Highmark Freedom Blue, UPMC for Life, Geisinger Gold, Aetna Medicare, Capital Senior Blue, Keystone 65, Personal Choice 65, Cigna, Wellcare, Devoted, Clover, Humana Gold Plus, UnitedHealthcare Dual Complete, and more.
Medicare Supplement (Medigap)	AARP/UnitedHealthcare, Mutual of Omaha, Cigna, and Aetna Medigap plans.
Medicaid, HealthChoices MCOs, CHIP & CHC	PA Medical Assistance (FFS), Keystone First, UPMC for You, AmeriHealth Caritas PA, Highmark Wholecare, Geisinger Family, PA Health & Wellness, UHC Community Plan, Health Partners Plans; CHIP and Community HealthChoices (LTSS) plans.
Federal programs	BCBS Federal Employee Program, GEHA, MHBP, NALC, APWU, Compass Rose, SAMBA (FEHB); TRICARE East, TRICARE For Life, VA Community Care Network, CHAMPVA, and Federal Black Lung.
Workers' comp & auto no-fault	SWIF, PMA, Erie, Liberty Mutual, Travelers, The Hartford, plus WC TPAs (Sedgwick, Gallagher Bassett, Broadspire, ESIS) and auto MedPay/PIP (Progressive, Allstate, Nationwide, GEICO, USAA, State Farm). Routed to the right specialty channel, not the standard clearinghouse.
Rental PPO networks (router rows)	Anthem/Elevance BlueCard, First Health, and MultiPlan/PHCS — so you bill the plan on the member's card, not the network.

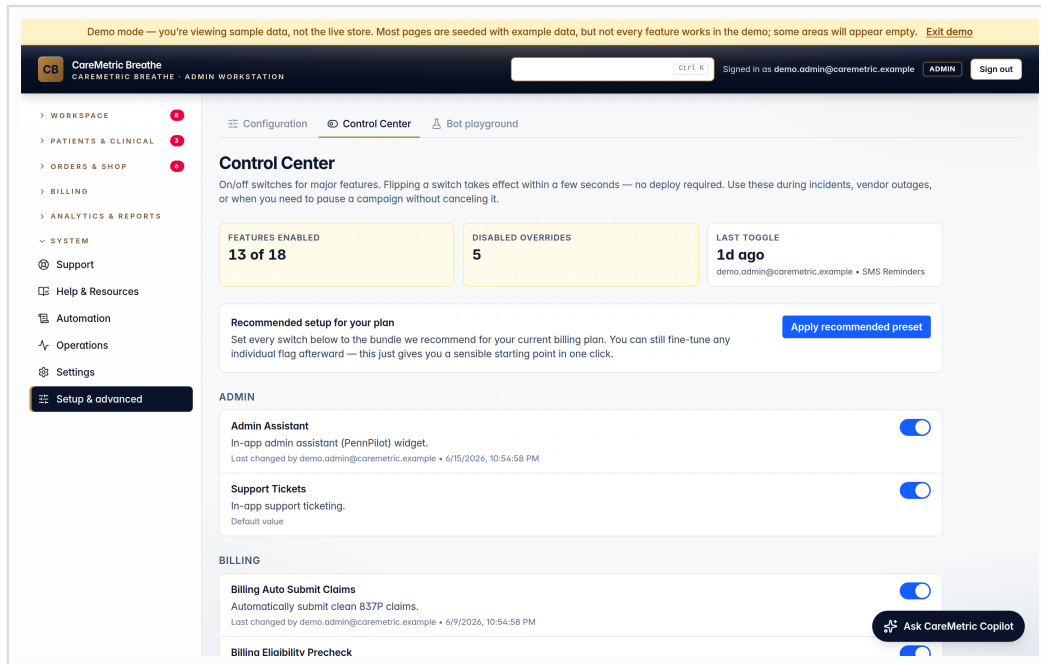

What every payer profile already knows

Identity	CSR-friendly display name, the legal name as it appears on EDI enrollment, the parent organization, and a stable internal code.
Electronic IDs & format	Office Ally payer ID, 5010 payer ID, and ERA payer ID; the claim format (837P, 837I, or paper CMS-1500); and EDI/ERA enrollment status.
Submission rules	Timely-filing window, any required claim modifiers (e.g. Medicare's KX), whether electronic secondary/COB is accepted, whether a referring-provider NPI is required, and a member-ID format hint/pattern.
Prior authorization	Whether capped-rental DME needs prior auth, the submission method (portal, fax, phone, electronic 278, or paper), the PA phone/fax, and the expected turnaround.
Claims routing	Claims mailing address (and a separate appeals address when different), claims phone/fax, the provider-portal URL, and the fee-schedule source.
Bookkeeping	Free-form payer-level notes (PHI-free), an active/inactive flag, and a last-verified date and author so the team can spot stale entries at a glance.

***Tip** Payer profiles are platform-wide and operator-maintained, so every tenant inherits the same vetted catalog. Manage them under **Billing** → **Config** → **Payers**: filter by region or line of business, add or edit a payer in a drawer (no deploy needed), and export the catalog in Office Ally's enrollment-review format for quarterly payer-ID updates.*

The Control Center — every toggle explained

The Control Center (**System** → **Setup & Advanced** → **Control Center**) is the master switch panel. Every major capability has a boolean on/off toggle that takes effect immediately — no deploy needed. Toggles are Owner-controlled and every change is recorded. The tables below list every toggle, its default, and what it does. A feature whose key shows after a dot (for example `billing.auto_submit_claims`) is the exact key you will see in the panel. Many automations also require a matching credential or schedule to actually act — turning the toggle on without it is safe (it simply stays idle).

The Control Center — master on/off switches for every major feature, grouped by area.

■ Messaging

SMS — reminders

`sms.reminders`

● On by default

Outbound SMS resupply reminders (90/30-day reorder nudges). Disabling stops the reminder dispatcher from sending new SMS.

Email — reminders

`email.reminders`

● On by default

Outbound email resupply reminders. Disabling stops the reminder dispatcher from sending new email.

Bulk campaigns — send

`bulk_campaigns.send`

● On by default

Sending of bulk-messaging campaigns to opted-in patients. Disabling stops the bulk-campaign worker from sending new messages.

Outreach playbooks — dispatcher

`outreach_playbooks.dispatcher`

● On by default

Outreach playbooks — scheduled SMS/email touches and call tasks for patient outreach runs started by staff. Turning this OFF pauses all pending playbook touches without cancelling the runs.

Smart triggers — dispatcher

`smart_triggers.dispatcher`

● On by default

Smart-trigger reorder dispatcher (therapy-night patterns). Disabling stops the dispatcher from queueing new reminders.

Patient onboarding — dispatcher

`patient_onboarding.dispatcher`

● On by default

First-90-day adherence-coaching nudges. Disabling stops the onboarding dispatcher from sending day-1/7/30/90 messages.

Fitter supply campaign — dispatcher

`fitter_supply_campaign.dispatcher`

● On by default

Multi-touch nurture campaign for patients who completed the at-home fitter but have not placed an order. Disabling stops the dispatcher from sending new touchpoints; in-flight conversions still attribute normally.

Reminder escalation — dispatcher

`reminder_escalation.dispatcher`

● Off by default

Daily multi-channel escalation for unanswered resupply reminders: follow up on the next channel (SMS then email) ~3 days after the first touch, then raise a CSR call alert once both channels are exhausted. Disabled keeps reminders to the single first-touch channel.

Alerts — auto dispatch

`alerts.auto_dispatch`

● Off by default

Allow server-side events to automatically send alert-library messages to patients (currently: the `payment_failed` alert on a Stripe invoice.`payment_failed` event). Disabled keeps the alert library admin-send only. Review patient-consent and wording before enabling.

Therapy fleet — auto outreach

`therapy_fleet.auto_outreach`

● Off by default

Therapy-fleet adherence auto-outreach: gentle SMS nudges to consented at-risk patients from the nightly fleet-alerts scan and the setup-deadline job. Also requires `sms.reminders` ON and Twilio configured; per-patient consent / DND / frequency caps still apply. SEEDER DISABLED.

Clinical outreach — dispatcher`clinical_outreach.dispatcher`

● On by default

Proactive clinical outreach: templated, consent/DND/frequency-cap-gated nudges to patients with an open non-adherence intervention. Scheduling is controlled by CLINICAL_OUTREACH_CRON; turning this OFF pauses the sends without changing the schedule. The admin "Run now" trigger is unaffected.

Fitter first day nudge — dispatcher`fitter_first_day_nudge.dispatcher`

● On by default

Fitter lead first-day nudge: a one-time email/SMS to new fitter leads on day one. Registration is gated by RESUPPLY_FITTER_FIRST_DAY_NUDGE_ENABLED; turning this OFF pauses the sweep without changing that env gate.

Fitter reengage — dispatcher`fitter_reengage.dispatcher`

● On by default

Fitter lead re-engagement: follow-up outreach to fitter leads who have gone quiet. Registration is gated by RESUPPLY_FITTER_REENGAGE_ENABLED; turning this OFF pauses the sweep without changing that env gate.

Patient packets — autosend on delivery`patient_packets.autosend_on_delivery`

● Off by default

Automatically email a new-patient document packet for e-signature the first time an order is delivered to a customer linked to a patient record. One-time per patient; the admin "Send packet" action is always available regardless of this toggle. OFF by default.

Patient packets — autoremind`patient_packets.autoremind`

● Off by default

Automatically re-send the signing link to patients who have not finished their document packet, on a fixed cadence with a maximum number of nudges. The sweep runs daily (override with PATIENT_PACKET_REMINDER_CRON); turning this OFF pauses the sends without changing the schedule. OFF by default.

■ Voice & AI

Email — auto reply

`email.auto_reply`

● Off by default

Chatbot email auto-replies. When ON, inbound patient emails are answered automatically by the storefront chat assistant (Claude Sonnet / GPT fallback); it hands off order/account/clinical or low-confidence messages to a human. When OFF, every inbound email is routed to the admin inbox for a manual reply.

Voice — agent

`voice.agent`

● On by default

Inbound voice agent (OpenAI Realtime). Disabling returns a 503 / hangup TwiML to any inbound call.

Telehealth — video

`telehealth.video`

● On by default

Telehealth video visits — staff-initiated browser video calls with patients for setups, troubleshooting, and follow-ups. Disabling blocks new visit creation and dead-ends outstanding join links.

Storefront — chatbot

`storefront.chatbot`

● On by default

Storefront chat assistant (Claude Sonnet / GPT fallback). Disabling makes the chat widget return a friendly "currently offline" message.

Admin — assistant

`admin.assistant`

● On by default

CareMetric Copilot — the in-app admin tech-support and program-manager assistant (renamable per tenant; "PennPilot" for the Penn tenant). When ON, signed-in staff can ask how the app works and where to find features, and the assistant can email feature suggestions to the super-admins (after confirming). Claude Sonnet / GPT fallback; degrades to an offline reply when no AI provider key is set.

Reminder escalation — voice

`reminder_escalation.voice`

● Off by default

Automated phone-call tier for the resupply-reminder escalation ladder. When ON (and the voice path is configured), an episode still unanswered after the SMS and email reminders gets an automated AI resupply check-in call before the ladder raises a CSR "call them" alert. Placed inside the patient's local 9am–8pm window. When OFF, the ladder is SMS → email → CSR alert.

Voice — breathe sales

`voice.breathe_sales`

● Off by default

CareMetric Breathe B2B platform sales voice agent. When ON (and a sales phone number is configured), inbound calls to the dedicated platform line reach an AI sales rep that pitches the platform to prospective DME businesses, emails them information, captures leads for follow-up, and can start a tenant sign-up on the call. Seeded OFF — it answers regulated calls and costs real voice spend, so enable it once the sales number is wired up.

Support — tickets

`support.tickets`

● On by default

Support tickets — tenants file support requests to the platform operator; an AI bot answers from the admin-console knowledge base on intake (Claude / GPT fallback) and escalates anything it cannot confidently answer to a human. Degrades to a hand-off when no AI provider key is set.

■ Storefront

Storefront — checkout (retired)

`storefront.checkout`

● On by default

Retired. Patients are billed to insurance and are never charged a card, so there is no storefront checkout for this toggle to gate. The row still exists in Control Center; changing it has no effect.

Storefront — pickup (retired)

`storefront.pickup`

● Off by default

Retired. It offered in-store pickup at a checkout that no longer exists. Arrange a pickup with the patient directly instead; changing this toggle has no effect.

Storefront — reviews collection

`storefront.reviews_collection`

● On by default

Post-delivery review-request emails. Disabling stops new review-request emails; previously-sent ones still accept submissions.

Storefront — NPS

`storefront.nps`

● On by default

Post-delivery NPS survey emails. Disabling stops new NPS sends; previously-sent surveys still record responses.

Cart abandonment — dispatcher (retired)

`cart_abandonment.dispatcher`

● On by default

Retired. There is no cart to abandon — the storefront does not sell. Changing this toggle has no effect; use Bulk Campaigns for outreach to patients who dropped out of a fitting.

Storefront — auto reminder enrollment

`storefront.auto_reminder_enrollment`

● Off by default

On a paid storefront order, auto-enroll the buyer in replacement reminders for the consumables they purchased (mask/cushion/tubing/filter/etc.) at the standard cadence. Email-only, with a manage/unsubscribe token; never re-enrolls a prior unsubscribe. Disabled keeps reminder enrollment to the explicit /reminders opt-in. Review consent before enabling.

Billing

AI billing — suggestions

`ai_billing.suggestions`

● On by default

AI-assisted billing claim suggestions in the billing AI queue. Disabling returns suggestions as "AI offline"; manual workflow is unaffected.

Billing — auto submit claims

`billing.auto_submit_claims`

● Off by default

Unattended auto-submission of submission-ready claims to Office Ally by the `billing.auto-submit-batch` worker. When ON (and `CLAIMS_AUTOSUBMIT_CRON` is set) the cron batches draft claims that pass preflight with no blocking errors AND have active eligibility on file, then transmits them per payer. When OFF, the cron is a no-op; the operator-driven staged-approval submit (Billing → Auto-submit) still works regardless. SEEDED DISABLED.

Billing — auto submit prior auths

`billing.auto_submit_prior_auths`

● Off by default

Unattended automatic Da Vinci PAS submission of draft prior authorizations by the `billing.prior-auth-auto-submit` worker. When ON (and `PRIOR_AUTH_AUTOSUBMIT_CRON` is set) the cron front-loads draft PAs that carry a coverage through the same submit core as the manual button; PAs missing a diagnosis, payer PAS endpoint, credentials, or address are skipped and retried. When OFF, the cron is a no-op; the operator-driven manual submit still works regardless. SEEDED DISABLED.

Billing — eligibility precheck

`billing.eligibility_precheck`

● Off by default

Before batch-submitting 837P claims to Office Ally, consult each claim's most recent parsed 270/271. A claim whose coverage is explicitly inactive or requires prior auth is held back and the batch returns `eligibility_blocked` with the offending claim ids. Fail-open: no/stale eligibility result allows the claim through. Pairs with `resupply.eligibility_enforcement` (the order-confirm coverage guard).

Billing — eligibility precheck refresh

`billing.eligibility_precheck_refresh`

● Off by default

When `billing.eligibility_precheck` is on AND real-time eligibility is configured, the claim-submit precheck additionally runs a fresh real-time 270 for any coverage in the batch with no recent parsed 271 (deduped per coverage, capped per batch). Off → the precheck only consults cached results. Auto-firing 270s has a per-transaction cost, so this is opt-in separately.

Insurance — discovery

`insurance.discovery`

● Off by default

Insurance discovery add-on. When ON (and the Office Ally discovery endpoint is configured), staff can search the payer network from a patient's demographics to find active coverage when their insurance is unknown or a coverage on file came back inactive. Seeded OFF — it is a paid add-on that triggers real clearinghouse spend, so enable it for tenants that have purchased it.

Billing — line ordering provider

`billing.line_ordering_provider`

● Off by default

Emit the line-level ordering-provider loop (837P 2420E NM1*DK) on each claim line, sourced from the claim's referring (prescribing) provider. DMEPOS-strict placement so Medicare's PECOS edit binds at the line; additive to the claim-level 2310D referring loop. SEEDED OFF — turning it on changes the live 837P, so validate against a live 277CA in the Office Ally test (T) cycle first.

Billing — payment plan autocharge

`billing.payment_plan_autocharge`

● Off by default

Auto-charge due patient payment-plan installments against the patient's authorized card. Off by default.

Billing — patient autopay
billing.patient_autopay

● Off by default

Auto-charge a patient's outstanding balance against the card they saved and authorized in the patient portal. Off by default; each patient also controls their own autopay toggle.

Billing — auto secondary claims

billing.auto_secondary_claims

● Off by default

Auto-draft a secondary / coordination-of-benefits claim when a primary payer pays a claim that carries a secondary coverage and leaves a patient-responsibility balance. The secondary lands in draft for a biller to review and submit — never auto-submitted. Off by default; when off, use the manual COB worklist at /admin/billing/secondary-eligible.

Eligibility — auto reverify
eligibility.auto_reverify

● On by default

Scheduled eligibility re-verification: fires fresh 270s for the most-urgent active coverages (throttled + capped per run). Scheduling is controlled by ELIGIBILITY_REVERIFY_CRON; turning this OFF pauses the unattended 270s without changing the schedule. The admin "Run batch now" trigger is unaffected.

Billing — bill hold
billing.bill_hold

● On by default

Bill hold. When ON, a claim cannot be submitted to the clearinghouse while it has any outstanding REQUIRED signed-paperwork requirement; the hold lifts automatically when the last one comes back (manual mark, portal e-sign, upload, or an inbound fax auto-matched to it). A claim with no tracked requirements is never held. When OFF, the gate is skipped entirely.

Billing — bill hold auto remind
billing.bill_hold_auto_remind

● Off by default

Bill-hold auto-reminders. When ON (and the opt-in BILL_HOLD_SWEEP_CRON is scheduled), the sweep job sends a reminder for paperwork that has been outstanding past the reminder threshold. When OFF, the sweep still recomputes holds and seeds requirements but sends nothing — reminders are sent only from the per-requirement "remind" action.

Billing — ADR / audit-response queue
billing.adr_queue

● Off by default

Medicare ADR / audit-response queue + audit-packet builder. When ON, staff can log payer/contractor Additional Documentation Requests against their response deadline, assemble the requested chart documents + generated summaries into one audit-packet PDF, and record the outcome. A nightly SLA sweep surfaces at-risk/overdue deadlines. When OFF, the queue and builder are hidden and the sweep no-ops.

Collections — dunning ladder
collections.dunning

● Off by default

Patient A/R dunning ladder. When ON, unpaid patient-responsibility balances escalate on a cadence (statement → reminder → second notice → final notice → agency), pausing automatically the moment the balance is paid or the patient goes onto a payment plan / autopay. Consent + quiet-hours are always enforced. When OFF, the open-scan and tick jobs no-op.

Collections — agency export
collections.agency_export

● Off by default

Collections-agency hand-off export. When ON, balances that reach the agency step can be exported (formula-injection-guarded CSV) for a collections agency. Nothing is ever sent to an agency automatically — the export is a reviewed, deliberate action. When OFF, the agency step simply parks the balance for review.

■ Resupply

Resupply — entitlement enforcement

`resupply.entitlement_enforcement`

● Off by default

Block a resupply confirmation when the item is not yet payable under the Medicare/payer replacement schedule (too soon since last dispense, or over the per-period quantity cap). When ON, a blocked reorder is routed to a CSR via a `resupply_too_soon` alert instead of shipping. When OFF, confirmations ship as before. Fails open on any eligibility-lookup error.

Resupply — eligibility enforcement

`resupply.eligibility_enforcement`

● Off by default

Consult the cached 270/271 eligibility result at order-confirm time. When ON and the patient confirms a resupply, an explicitly inactive plan or a prior-auth-required flag raises a `resupply_coverage_blocked` CSR alert and routes the order to the work queue instead of auto-shipping. Fail-open: no/stale result allows the order. When OFF, the coverage check is skipped (cadence/quantity entitlement is gated separately by `resupply.entitlement_enforcement`).

Resupply — usage compliance check

`resupply.usage_compliance_check`

● Off by default

Continued-use check at resupply order-confirm time. When ON and the patient confirms a resupply, recent therapy data (`patient_therapy_nights`, last 30 days) showing the device is effectively unused raises a `resupply_usage_review` CSR alert and routes the order to the work queue instead of auto-shipping — protecting against continued-use claim denials. Fail-open: no data, sparse data, or any lookup error allows the order. When OFF, the check is skipped.

Resupply — refill affirmation capture

`resupply.refill_affirmation_capture`

● On by default

Record the beneficiary's Medicare/payer refill attestation (still using the device + current supply running low) as an audit-grade `refill_confirmations` row each time a resupply order is confirmed (SMS YES, email-link click, voice, or admin). Captured AFTER a successful confirm; a write failure never blocks the order. ON by default — this is a compliance documentation baseline, not a change to the ship decision. When OFF, no attestation row is written.

Resupply — refill window enforcement

`resupply.refill_window_enforcement`

● Off by default

Enforce the CMS DMEPOS refill SHIP window at order-confirm time: block a resupply that would ship earlier than 10 days before the current supply's expected depletion (last dispense + the HCPCS supply duration), routing it to a CSR via a `resupply_refill_too_early` alert instead of shipping. When OFF, the confirm-time interval/quantity entitlement guard is the only timing gate. Fail-open: a first fill, an unmapped SKU, or any lookup error allows the confirmation through.

Resupply — auto order drafts

`resupply.auto_order_drafts`

● Off by default

Auto-stage resupply order drafts from device-eligible supplies (daily worker). Drafts are proposals a CSR reviews and approves into an order — nothing is created or charged automatically. Seeded OFF; CSRs can still stage drafts manually from the resupply opportunities page. Enable per tenant in the Control Center.

Asset recovery — auto populate

`asset_recovery.auto_populate`

● Off by default

Nightly auto-population of asset-recovery cases from discontinuation signals (undismissed usage-dropping smart triggers). When off, cases are opened only manually from `/admin/asset-recovery`.

■ Orders

Orders — require signed paperwork

`orders.require_signed_paperwork`

● Off by default

Require required intake paperwork (HIPAA NPP, Assignment of Benefits, Supplier Standards) to be signed before a patient-linked order can be marked shipped. Off by default — turning it on blocks shipment until paperwork is on file. A per-payer requirement (`payer_profiles.requires_signed_paperwork`) can also impose this for specific payers while this stays off.

■ Documents

Patient packets — autofile signed pdf

`patient_packets.autofile_signed_pdf`

● On by default

Automatically file the signed e-sign packet PDF (documents + signature certificate) onto the patient's chart when the patient completes signing. Internal record-keeping only — no messages are sent. ON by default.

■ Provider Portal

Provider — portal enabled

`provider.portal_enabled`

● Off by default

Secure provider e-signature portal: physicians/NPs sign in (MFA-protected) to e-sign outstanding orders/prescriptions/claims; employees track + release signed items and print the signature audit log.

■ Integrations

Domains — TLS automation

`domains.tls_automation`

● Off by default

NOT YET ACTIVE in this build — the TLS automation has not shipped, so this toggle currently has no effect. When it lands: automatically provision + renew TLS for tenant custom domains via Cloudflare for SaaS (Custom Hostnames) when a domain is verified. Requires `CLOUDFLARE_API_TOKEN` + `CLOUDFLARE_ZONE_ID`. Off = manual operator edge binding.

Slack — team notifications

`slack.notifications`

● On by default

Post real-time CS alerts (a patient reply needing a human, a voice post-call hand-off, an SLA breach) into the operator's Slack channel. Inert until a Slack bot token + alerts channel are configured in System Configuration. Messages are non-PHI (reference + status + a deep link into the admin console).

Slack — interactivity

`slack.interactivity`

● On by default

Accept inbound Slack button clicks (Escalate) and the slash command. Every request is verified against the Slack signing secret; inert until that secret is configured in System Configuration.

Slack — operator digests

`slack.digests`

● On by default

Also post the operator digests (owner weekly KPIs, metric alerts, stuck-job monitor, low-stock inventory) into Slack. Routes to the optional digests channel, else the alerts channel. Inert until Slack credentials are configured. Non-PHI (counts / KPI headlines / SKU + queue names). The email path is unchanged.

■ Operations

Failed email digest — dispatcher

`failed_email_digest.dispatcher`

● On by default

Daily failed-order email digest: a single summary email to the ops alerts address listing orders whose confirmation email failed in the last 24h (order reference + timestamp only — no patient PHI). Scheduling is gated by `RESUPPLY_FAILED_EMAIL_DIGEST_ENABLED`; turning this OFF pauses the digest without changing that env gate.

Multi location — enabled

`multi_location.enabled`

● Off by default

Multi-branch company. When ON, the admin console shows the Locations page plus per-patient and per-staff branch assignment, a branch filter on the patients list, and per-branch counts. When OFF (the default), the company is treated as a single branch and none of the branch UI appears. Billing identity is shared at the org level in both modes.

Fax — auto file signed

`fax.auto_file_signed`

● Off by default

Inbound-fax barcode auto-filing. When ON, every received fax is scanned (via the existing Claude vision path) for the platform's signature-tracking code (PFS-XXXXXXX). On an exact unique match to an outstanding signature, the fax is filed into the patient's chart, the signature is marked returned & signed (advancing the source prescription packet), and any claim paperwork requirement it was sent to clear is satisfied (releasing the bill hold). When OFF, faxes are triaged by hand exactly as before. Degrades to hand-triage whenever no AI key is configured or the scan finds no code.

Fax — referral review

`fax.referral_review`

● Off by default

AI referral reviewer for inbound faxes. When ON, every received fax that is not barcode auto-filed is queued for one AI extraction pass (Claude document path) that pulls the referral's patient demographics, insurance, ordered items, sleep-study results, and referring physician into a review the staff can edit and explicitly accept — accepting creates the patient record, the insurance coverage, and files the split per-section PDFs to the chart. Nothing is entered into the system without that explicit accept. When OFF, faxes triage exactly as before; the manual "Upload referral PDF" reviewer remains available either way. Degrades to hand-triage when no AI key is configured.

Frontdesk — counter orders (retired)

`frontdesk.counter_orders`

● On by default

Retired with the Front Desk page. A walk-in is handled like any other patient: verify the benefit and raise the order against their plan. Changing this toggle has no effect.

■ Referrals

Referrals — adherence report

`referrals.adherence_report`

● Off by default

Automatically send a patient's 90-day CPAP adherence attestation (Medicare LCD L33718) to their REFERRING PROVIDER, by fax (preferred) or email, once the patient reaches the 90-day therapy mark. This is a PHI disclosure to the treating/referring provider — a permitted treatment/care-coordination disclosure that you opt into deliberately. Seeded OFF: turn it on only once you have decided the disclosure is appropriate and your providers' fax/email is set up to receive it. Each patient's 90-day report is sent at most once. When OFF, nothing is sent.

■ Clinical

Fitter — multiframe capture

`fitter.multiframe_capture`

● Off by default

Guided multi-angle scan capture: a live coach walks the patient through three angles (front, then a slight turn each way) with real-time quality checks (lighting, distance, head position, obstruction, movement), and the measurements are cross-checked across frames for agreement — producing a measurement confidence score instead of a single unverified snapshot. Falls back to single-frame capture automatically on devices that cannot run the live face tracker. OFF keeps the one-photo capture.

Part 1 — Feature Summary by Role

A quick reference: every feature with a one-line description, grouped by the role that uses it most. Part 2 describes each in depth.

ADMINISTRATOR (OWNER & ADMIN)

Administrator

Run the whole practice — setup, team, money, and the controls that govern every other role.

Command center

Home dashboard	Today's work, live KPI counters, and quick links into every queue.
CareMetric Copilot	Floating in-app assistant that answers “how do I... / where is...” and can email feature ideas to the owner.
Support	File a support request and get instant how-to answers from the assistant.

Setup & identity

Set Up Your Workspace	Guided checklist: brand, domain, phone/SMS/fax, email sender, and payments.
Company Information	Legal name, addresses, and contacts printed on documents, the storefront, and messages.
Storefront Branding	Storefront name, tagline, logo (or a one-click starter monogram), and custom-domain wiring.
Phone & SMS / Fax / Email	Provision dedicated voice, SMS, and fax numbers for the practice and set the From email address.
Locations	Define service branches (multi-branch practices) and assign them to patients.
Account Security	Enroll your own multi-factor authentication (authenticator app).

Team & control

Team	Invite staff, set their role (Owner, Admin, CSR, Biller, RT), revoke access, and link each teammate's Slack handle.
Control Center	On/off switches for major features — voice agent, campaigns, auto-submit, AI billing, chatbots.
Recommended preset	One-click “set my feature flags to the bundle for my plan” — adopt or re-baseline the recommended set after picking or switching a plan.
System Configuration	Owner-only vault for integration credentials and platform secrets.
Automation Rules / Rule Tester	“When X happens, do Y” automations, with a dry-run tester before you go live.
Compliance Rules	Per-payer CPAP adherence thresholds (minimum hours / nights).
Bot Playground	Rehearse the chat and voice bots against scripted situations to tune them.

Operations & integrations

Operations	Health of background jobs and pipelines (worker, nightly sync).
Integrations	Therapy-cloud connections (ResMed AirView, Philips Care Orchestrator, 3B React Health) and sync status.
Slack notifications	Post real-time CS alerts and operator digests into your team's Slack channel; act on them with Escalate buttons and a slash command.
PacWare	CSV import/export bridge to the PacWare billing/warehouse system.
Outbound Messages / Delivery Failures	Every SMS & email with its delivery result; retry or resolve bounces.
Webhook Deliveries	Outbound event deliveries to partner endpoints; re-queue failed sends.

Analytics & goals

Reports	Exportable CSV/PDF/QuickBooks reports for ops and finance.
Audit Trail	Who accessed which patient's information, and when — filter by employee, patient, and time frame (admins only).
Financial analytics	Margin & COGS, LTV:CAC, inventory turnover, revenue by source, outreach attribution.
Performance & Goals	Team throughput, live staffing load, KPI targets, and threshold alerts.
Clinical & customer analytics	Resupply funnel, reorder reminders, NPS, and storefront traffic.

 BILLER

Biller

Own the revenue cycle — eligibility, claims, A/R, and getting every dollar collected.

Dashboards

Billing Hub	A/R director view — money in flight, top payers, and an aging summary.
Denials & DSO	90-day denial rate and days-to-pay per payer, with trend lines.
Collections Forecast	Projected cash from claims in flight, bucketed by expected landing date.
Chargeback Disputes	Card chargebacks against storefront charges, ordered by evidence deadline.
Payer Profitability	Net yield per payer: billed → allowed → collected, net of cost.

Claim worklists

Verify Insurance	Run a one-off 270/271 eligibility check for any patient.
Insurance Discovery	Find active coverage from demographics when the plan is unknown.
Eligibility	System-wide 270/271 worklist; rejected and inactive coverage rises to the top.
Re-verification	Active coverages due for a re-check (stale, terminating, never checked).
Prior Auths	At-risk SLA, auths expiring soon, and drafts to submit (incl. Da Vinci PAS).
CMN / DIF Worklist	Certificates of Medical Necessity awaiting completion.
Bill Hold	Claims held from billing until signed paperwork is back.
Auto-submit	Preflight-clean claims ready to transmit — approve a batch or let the cron send.
AI Queue	Scrubber-blocked + denial-analyzer worklist with auto-resubmit suggestions.
Denials Worklist	Open denials ranked by recoverable dollars × win-probability.

A/R & collections

A/R Aging	Open claims by 0/30/60/90-day bucket and by payer.
Filing Deadlines	Open claims ranked by days left before timely-filing closes.
Secondary Claims	Coordination of benefits — roll the primary's balance to the secondary payer.
Statement Send	Send patient-responsibility statements by email/SMS, consent-aware.
Collections	Patient balances on a dunning ladder (statement → reminder → notices → agency) that auto-pauses the moment a balance is paid or on a plan.
Capped Rentals	13- and 36-month CMS rental cycle tracker with KH/KI/KX modifier rotation.
ADR / Audit Response	Payer/contractor documentation requests ranked by deadline, with a checklist and win-rate outcomes.
Audit Packet	Assemble a complete CPAP/PAP documentation packet (SWO, CMN, sleep study, compliance, POD...) as one PDF.

Tools & configuration

ERA Files	Upload an 835 to auto-post payer adjudications.
Office Ally	Clearinghouse 837P submissions, acknowledgements, and transmission status.
Manual Claim	Key a corrected / void-replacement / paper-backup claim by hand.
Billing Config	Payer profiles, fee schedules, modifier rules, denial codes, claim templates.
Package & Usage	Your CareMetric subscription plan, add-ons, and monthly usage.

 CUSTOMER SERVICE REP (CSR)

Customer Service Rep

The patient's first point of contact — messages, orders, scheduling, and day-to-day service.

Daily workspace

Home	Today's worklist and live counters across every queue.
Conversations	Unified SMS/MMS/email inbox — triage, reply, assign, and escalate.
Email Inbox	Inbound patient email split into needs-response vs. answered, with AI draft replies.
Cases	Multi-channel tickets that link conversations, orders, faxes, and documents.
Episodes	Dated follow-up promises and open service episodes.

Schedule & outreach

Company Calendar	Shared team schedule of fittings, setups, follow-ups, and video visits.
Video Visits	Telehealth visits with secure join links sent by SMS/email.
Follow-ups	Today's callback queue across customers and patients.
Bulk Campaigns	Batch SMS/email sends with audience filters and a recipient sanity-check.
Alert Library / Reminders	One-off patient alerts and the resupply reminder schedule.
Playbooks / Canned Replies / Automated Messages	Reusable outreach cadences, saved reply snippets, and system-message copy.

Patients & paperwork

Patients	Patient roster and the 360° timeline (orders, messages, documents, therapy, billing).
Duplicate Review	Find and merge likely-duplicate patient records.
Documents & Packets	Draft CMNs/prescriptions/agreements and send e-signature packets.
Awaiting Signatures / Inbound Faxes	Track documents out for signature; triage inbound faxes.
Referral Reviewer / Sources	AI-extracted intake from faxed referrals; referring-physician scorecards.

Orders, catalog & leads

Fit Requests	Finished fittings waiting for someone to verify the benefit and place the order.
Orders	Insurance orders — fulfill, track, and look up.
Shipping Labels	Print shipping labels with the patient address merged; tracking auto-fills.
Catalog	The SKUs you dispense and what is on the shelf; stock moves as a reasoned movement, never a typed total.
Backorders	Mark a SKU out of stock and set the substitution the fulfillment path should use instead.
Insurance Leads	Work new benefit-verification requests from the storefront.
Fitter Invites & Prospects	Invite patients to the AI mask fitter and track the conversion funnel.

 RESPIRATORY THERAPIST (RT)

Respiratory Therapist

Watch therapy, keep patients adherent, and document the clinical care that backs every claim.

Therapy monitoring

RT Overview	At-a-glance therapy board with alerts, AHI, leak, and usage per patient.
Therapy Fleet	Population compliance cohorts and the clinical outreach worklist.
Setup Adherence	CMS 90-day adherence tracker for new Medicare setups.
Resupply Opportunities	Device-reported supplies due for replacement.
RT Outcomes	Per-therapist activity: encounters, patients, and interventions.

Clinical work

Clinical Encounters	Document and review patient clinical encounters (notes, assessment, plan).
Interventions	Non-adherence intervention worklist — cause, plan, and outcome tracking.
Mask-fit Feedback	Triage patients reporting a leaking or uncomfortable fit.
Clinical Outreach	Send supportive check-ins to patients with an open intervention (consent/DND-aware).
Adherence Coaching	Outreach plans for patients whose CPAP use is slipping.
Video Library	Manage the short-video education library shown on the storefront.

Providers, devices & reports

Providers	Central physician/NP registry (NPPES-backed).
Recalls	Manufacturer recall registry scanned against dispensed serials.
Asset Recovery	Recover machines from discontinued patients to refurbish and redeploy.
Therapy Report	Provider-ready, print-quality adherence snapshot by provider, patient, or device.
Patient clinical timeline	The clinical tab of the patient 360° view — therapy data, prescriptions, history.

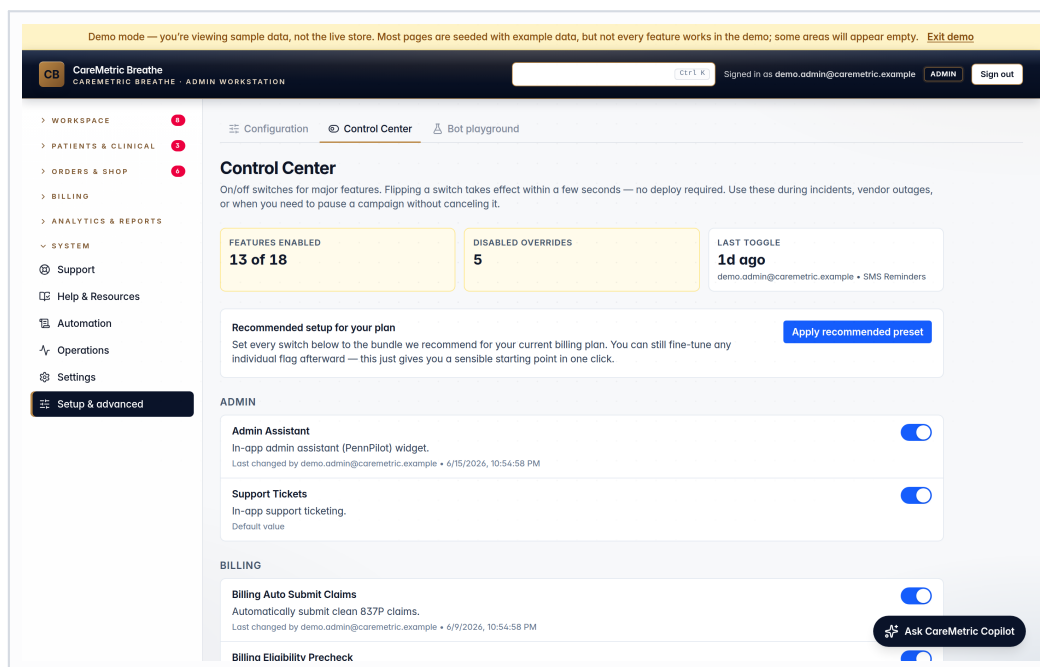

Part 2 — Comprehensive Feature Reference by Role

The full detail on every feature: what it's for and how it fits your day, grouped by role and by the area of the console where you find it.

ADMINISTRATOR (OWNER & ADMIN)

Administrator

Run the whole practice — setup, team, money, and the controls that govern every other role.

Control Center — the master on/off switches for major platform features.

Command center

Home dashboard. The landing page after sign-in. It rolls up today's work — conversations awaiting reply, overdue follow-ups, returns to action, appointments — alongside live KPI counters (active conversations, fulfillments this week, paused patients) and one-click links into each queue. Use it as your morning triage board; every tile deep-links to the full list.

CareMetric Copilot (admin assistant). A floating assistant on every admin page. It does two jobs: (1) tech support — it knows the entire console map and answers “how does X work / where is the page that does Y,” returning clickable links; and (2) product feedback — its one action, after you confirm, emails a structured feature idea to the owner(s). It never takes other actions and never echoes patient PHI. The Penn Home Medical Supply tenant brands it “PennPilot.”

Support. A simple form to file a support request, with the assistant on hand to answer how-to questions instantly before you escalate.

■ Setup & practice identity

Everything that makes the platform “yours.” Most of this lives under System → Settings.

Set Up Your Workspace. A guided checklist that walks a new practice through the core steps: brand and logo, custom domain, phone/SMS/fax numbers, the email From address, and payment processing. The Home dashboard shows a “finish setting up” banner until the essentials are done.

Company Information. Your legal practice name, addresses, NPI/tax identifiers, and contacts. These values are merged onto documents (CMNs, statements), the storefront, and outbound messages, so keep them accurate.

Storefront Branding. The patient-facing storefront's name, tagline, logo, and theme, plus custom-domain wiring (e.g. a tenant domain that routes only to your storefront). No logo yet? One click generates a **starter monogram** tile from your storefront name (entirely in the browser) so the storefront never shows a blank logo while you source artwork.

Phone & SMS, Fax, Email From Address. Messaging works from day one: until you provision your own number, patient texts, calls, and faxes go out on a **shared platform number**, and an inbound reply is routed back to the tenant that owns the patient — so two-way texting works across tenants before anyone has their own line. When you want messages to originate from **your practice's own number**, dedicated voice, SMS, and fax numbers are **provisioned for you through the platform's telephony carrier (Twilio/Telnyx)** — you don't bring or port your own line, and there's no separate carrier account to manage. Email uses the platform default From address until you set your own; deliverability then requires your sending domain to be SPF/DKIM-authenticated, and that status is shown here.

Locations. For multi-branch practices: define each service branch and assign patients to them. Appears only when multi-location is enabled in Control Center.

Account Security. Enroll and manage your own multi-factor authentication (authenticator-app TOTP). Strongly recommended for every admin.

■ Team & platform control

Owner-tier governance. Some items are restricted to the Owner role.

Team. Invite staff by email, assign a role — Owner, Admin, Customer Service Rep, Biller, or Respiratory Therapist — and manage access (resend invite, revoke, delete, change role). Invitees receive a sign-up link and must accept before they can log in. The last active Owner cannot be demoted (a safety lock). You can also link each teammate's **Slack handle** here, so Slack escalations and slash-command actions are attributed to the right person. Owner-only.

Control Center. The master on/off panel for major features: the voice agent, SMS/email campaigns, claim auto-submit, AI billing, the storefront chatbot, the admin assistant, multi-location, and more. Toggles take effect immediately.

Recommended preset. A one-click card in the Control Center that sets your feature flags to the recommended bundle for your billing plan (Virtual Mask Fitter, Launch, Growth, Scale, or Enterprise). New tenants already

land on their plan's preset at onboarding; this lets an existing tenant adopt — or re-baseline to — the recommended set after picking or switching a plan, instead of toggling dozens of flags by hand. It previews the changes first, and you can still fine-tune any individual flag afterward.

System Configuration. The Owner-only vault for integration credentials (therapy-cloud, clearinghouse) and platform secrets. Restricted to the Owner role so secrets can never be viewed or entered by a lower role.

Automation Rules & Rule Tester. Build “when X, do Y” automations — for example, when an inbound message matches a phrase, send a reply or raise a flag. The Rule Tester dry-runs a rule against sample input before you enable it in production.

Compliance Rules. Set per-payer CPAP adherence thresholds (minimum hours per night, minimum nights) that the therapy-monitoring boards measure patients against.

Bot Playground. A safe sandbox to rehearse the chat and voice bots against scripted situations with synthetic data and simulated tools — use it to tune prompts before changing what patients experience.

■ Operations & integrations

Keep the plumbing healthy and the partner connections flowing.

Operations. The health board for background jobs and pipelines — the in-process worker, the nightly therapy sync, reminder dispatch. Shows what ran, what's queued, and what failed.

Integrations. Connect and monitor therapy-cloud vendors (ResMed AirView, Philips Care Orchestrator, 3B Medical React Health). Shows availability and nightly-sync status; credentials are entered under System Configuration.

Slack team notifications. Bring the work into your team's Slack. With a Slack bot token + channel set in System Configuration, the platform posts real-time CS alerts — a patient reply that needs a human, a voice post-call hand-off, an SLA breach — plus the operator digests (owner weekly KPIs, metric alerts, stuck-job monitor, low-stock inventory) into your channel. Staff can act right from Slack: an **Escalate** button and a slash command, every inbound request verified against your Slack signing secret. Messages are deliberately **non-PHI** — a reference, a status, and a deep link back into the admin console — never message bodies, phone numbers, or clinical detail. Three Control Center toggles govern it (`slack.notifications`, `slack.interactivity`, `slack.digests`); all are inert until the Slack credentials are entered.

PacWare. A CSV import/export bridge to the PacWare desktop billing/warehouse system (which has no API). Import fills only blank fields on existing patients (never overwrites); exports (patient roster, resupply-due worklist) include a verify step and formula-injection guards.

Outbound Messages & Delivery Failures. Every outbound SMS and email with its delivery result (sent/delivered/failed/bounced). Delivery Failures collects bounces and shipping exceptions to retry or resolve.

Webhook Deliveries. Outbound event deliveries to partner endpoints, with the ability to re-queue failed or exhausted sends and test-send events.

■ Analytics, reports & goals

The numbers that run the business. Most are finance-gated.

Reports. A catalog of exportable reports (CSV/PDF/QuickBooks) — revenue summary, orders, refunds journal, patient payments, insurance claims, customer activity, and more.

Patient-Access Audit Trail. An admins-only report of who accessed which patient's information, and when. Filter by employee, by patient, and by time frame to answer a “who looked at this chart?” question. It is kept out of the CSR and clinician sidebars (it requires the audit-read permission) and the page itself enforces full-admin access.

Financial analytics. Captured-cost economics: gross Margin & COGS by product, LTV:CAC by channel, inventory turnover and stockout demand, revenue by source, and outreach attribution.

Performance & Goals. Operational management: per-agent Team Throughput, real-time Live Staffing load, KPI Goals & Targets with pace-to-goal, and KPI Alerts that fire when a metric crosses a threshold.

Clinical & customer analytics. Resupply funnel and reorder-reminder conversion, post-delivery NPS with comments, and storefront traffic & revenue.

BILLER

Biller

Own the revenue cycle — eligibility, claims, A/R, and getting every dollar collected.

Demo mode — you're viewing sample data, not the live store. Most pages are seeded with example data, but not every feature works in the demo; some areas will appear empty. [Exit demo](#)

Ask CareMetric Copilot

The Eligibility worklist — system-wide 270/271 status, worst coverage first.

How the billing engine works, end to end

This is what makes CareMetric Breathe's revenue cycle different: the work happens ahead of you. The sections below explain the machinery; the worklists that follow are where you drive it.

The claim types it handles. Every bill is an insurance claim with a payer sequence. **Primary** claims are built automatically from a fulfillment (the shipped order) or keyed by hand. **Secondary / COB** claims are coordination-of-benefits bills the system can auto-draft once a primary pays and leaves a balance, snapshotting the primary's paid / contractual / patient-responsibility amounts into the 837P COB loop — they always land in *draft* for a biller to review, never auto-submit. **Capped-rental** claims are generated month by month for Medicare CPAP rentals, each seeded with the correct rental-month modifier. **Corrected / void-replacement / paper-backup** claims are keyed from the Manual Claim screen when an automated path doesn't fit.

Modifiers, applied by rule. Modifiers (RR rental, KH/KI/KJ capped-rental months, KX medical-necessity, NU purchase, GA/GZ ABN, LT/RT) are applied automatically from a per-payer rule store. Each rule is keyed to a payer + HCPCS + a condition — “rental month ≤ 3”, “rental month ≥ 4”, “compliant at 90 days”, “initial dispense”, “prior auth approved”, “ABN on file” — and the highest-priority match wins as the claim is built. Capped rentals rotate the month modifier for you: KH for months 1–3, KI from month 4, plus KX once the patient proves CMS compliance (≥4 hours on ≥70% of nights in a 30-day window). Hand-keyed claims pull the same modifiers so manual and automated claims bill identically.

Eligibility, five ways. The platform runs the 270/271 eligibility transaction for you in five places: (1) a real-time check that returns a 271 in seconds (or a deferred SFTP round-trip when real-time isn't configured); (2) a **quick check** you can run with no patient record at all — type a name, DOB, and member ID and read coverage back instantly; (3) the system-wide **Eligibility worklist** that surfaces rejected and inactive coverage first; (4) scheduled **auto-re-verification** that fires fresh 270s for the most-urgent active coverages on a cadence; and (5) an automatic **pre-submit precheck** that re-confirms coverage in the moments before a claim is transmitted and holds back anything inactive or needing prior auth.

One-click insurance verification, everywhere. A Verify-Insurance button rides on the patient chart, the patient's billing tab, and the eligibility worklist, plus a standalone cross-patient verifier — so anyone can confirm coverage in one click from wherever they already are, and the 271 result shows inline. No separate payer portal, no phone tree.

Insurance discovery. When a patient's plan is unknown — or a coverage on file came back inactive — Insurance Discovery searches the payer network from their demographics (name, DOB, ZIP, optional SSN/member-id) and returns the active coverages it finds, ready to attach. It turns “we don't know who covers them” into a billable claim. (A paid clearinghouse add-on; enable per tenant.)

Auto-submit to the clearinghouse. Submission-ready claims flow through a pipeline: a **preflight scrub** (required fields, HCPCS/diagnosis match) drops unsalvageable claims; an **eligibility gate** blocks stale or inactive coverage; the optional **AI scrubber** flags or fixes the rest; clean claims are **batched per payer** into 837P files and transmitted to Office Ally over SFTP, with control numbers tracked and 999 / 277CA acknowledgements reconciled automatically. You can drive it two ways — review and approve a staged batch yourself (Auto-submit), or let the scheduled cron transmit clean, eligible claims unattended. A **bill-hold gate** keeps any claim from going out while required signed paperwork is still outstanding, and lifts the hold the moment the last document is back.

AI claim scrubbing & denial recovery. Before submission the AI scrubber reviews each draft for semantic problems — wrong modifier for the rental month, quantity over the LCD limit, HCPCS/diagnosis mismatch, fee-schedule drift, duplicate risk — and returns a verdict (ready / fixable / blocking) with one-click patches. After a denial, the AI denial analyzer reads the CARC/RARC codes, explains the root cause, drafts the corrective steps and an appeal letter, and recommends the next move (resubmit, appeal, bill the patient, write off). When the fix is safe and confidence is high, it offers a one-click auto-resubmit. The **AI Queue** buckets all of this — blocking, fixable, needs-analysis, and auto-resubmit-ready — so a biller always works the highest-payoff claim first. PHI is minimized before anything reaches the model (names → initials, DOB → year, member IDs fingerprinted).

ERA auto-posting. Upload an 835 remittance and the system matches each claim block to your claims and posts the adjudication automatically — allowed, paid, and patient-responsibility amounts at both the claim and line level, a posted event with the check/EFT reference, and a status flip to paid or denied. Denied lines are handed straight to the denial analyzer. Re-posting the same file is a safe no-op (idempotent), so payer redeliveries never double-count.

■ Billing dashboards

Read-first views that tell you where the money is. Open these to know what to work next.

Billing Hub. The A/R director's home base: money in flight, top payers, aging summary, and the day's billing KPIs. Start here, then drop into a worklist.

Denials & DSO. Benchmark view of the trailing 90-day denial rate and trailing 180-day days-to-pay (DSO) per payer, with trend lines so you can see which payers are slipping.

Collections Forecast. Projected cash from claims already in flight, bucketed by the date you expect each to land — a near-term cash-flow forecast.

Chargeback Disputes. Card chargebacks raised against storefront charges, ordered by the evidence-submission deadline so nothing lapses.

Payer Profitability. Net yield per payer end to end: billed → allowed → collected, denial rate, and the result net of product cost. Finance-gated.

■ Claim worklists — the lifecycle

Worklists are ordered the way a claim moves: verify coverage, secure authorization, gather paperwork, submit, then fix and appeal.

Verify Insurance. Run a one-off 270/271 eligibility transaction for any patient on demand — a quick coverage check that doesn't need an existing patient record.

Insurance Discovery. When you don't know a patient's plan, search the payer network from their demographics to find active coverage.

Eligibility. The system-wide 270/271 worklist. Rejected and inactive coverage rises to the top so you fix the highest-risk claims first.

Re-verification. Active coverages due for a fresh check — never-checked, terminating soon, or stale beyond your interval.

Prior Auths. Authorizations missed or at risk of breaching SLA, auths expiring soon, and drafts ready to submit. Supports electronic Da Vinci PAS submission where the payer accepts it.

CMN / DIF Worklist. Certificates of Medical Necessity / DME Information Forms still awaiting completion before a claim can go out.

Bill Hold. Claims deliberately held from billing until their signed paperwork is back — work this list to release them once documentation lands.

Auto-submit. Claims that are preflight-clean and backed by active eligibility, ready to transmit. Approve a batch yourself or let the scheduled cron send them (the cron only fires when both the schedule and the Control Center flag are on).

AI Queue. Claims the scrubber blocked plus a denial-analyzer worklist; the assistant suggests the code or edit and, where safe, an auto-resubmit.

Denials Worklist. Open denials ranked by recoverable dollars × win-probability so you spend your time where it pays off most.

■ A/R & collections

Work claims and balances to get paid.

A/R Aging. Open claims bucketed 0/30/60/90+ days and broken out by payer — the classic aging worklist.

Filing Deadlines. Open claims ranked by days remaining before the payer's timely-filing window closes, so you never lose a claim to the clock.

Secondary Claims. Coordination of benefits: roll the primary payer's leftover balance onto the secondary payer's claim.

Statement Send. Send patient-responsibility statements by email or SMS. Consent- and quiet-hours-aware so you stay compliant.

Collections. Patient balances that have gone unpaid move automatically up a dunning ladder — statement (day 0) → reminder (day 7) → second notice (day 21) → final notice (day 35) → collection agency (day 60). The ladder **auto-pauses the instant a balance is paid or put on a payment plan**, so you never dun a patient who has already settled up. Batch-print the final-notice letters as one PDF, and export the agency-eligible accounts when you place them with a collections partner. (The dunning ladder is gated behind the **collections.dunning** flag and agency export behind **collections.agency_export** in the Control Center.)

Capped Rentals. Track CMS 13- and 36-month capped-rental cycles and rotate the KH/KI/KX modifiers automatically as each cycle advances.

ADR / Audit Response. When a payer or contractor sends an Additional Documentation Request, every open ADR lands here ranked by response deadline, with a per-request checklist of what to gather and a record of the win/loss outcome so you can see how the practice fares on audits. Gated behind the **billing.adr_queue** flag.

Audit Packet. Assemble a complete, audit-ready CPAP/PAP documentation packet — the Standard Written Order, CMN, sleep study, compliance summary, proof of delivery, and supporting notes — into a single PDF you can send to the payer in one click, instead of hunting the chart for each page.

■ Tools & configuration

The clearinghouse, payment posting, manual entry, and the payer rules behind it all.

ERA Files. Upload an 835 remittance and the system auto-posts the payer's adjudications against the matching claims, flagging denials for the worklist.

Office Ally. Your clearinghouse cockpit: 837P submissions, acknowledgements (999/277CA), and live transmission status. (Office Ally has a stub mode for preview environments.)

Manual Claim. Key a corrected, void/replacement, or paper-backup claim by hand when an automated path doesn't fit.

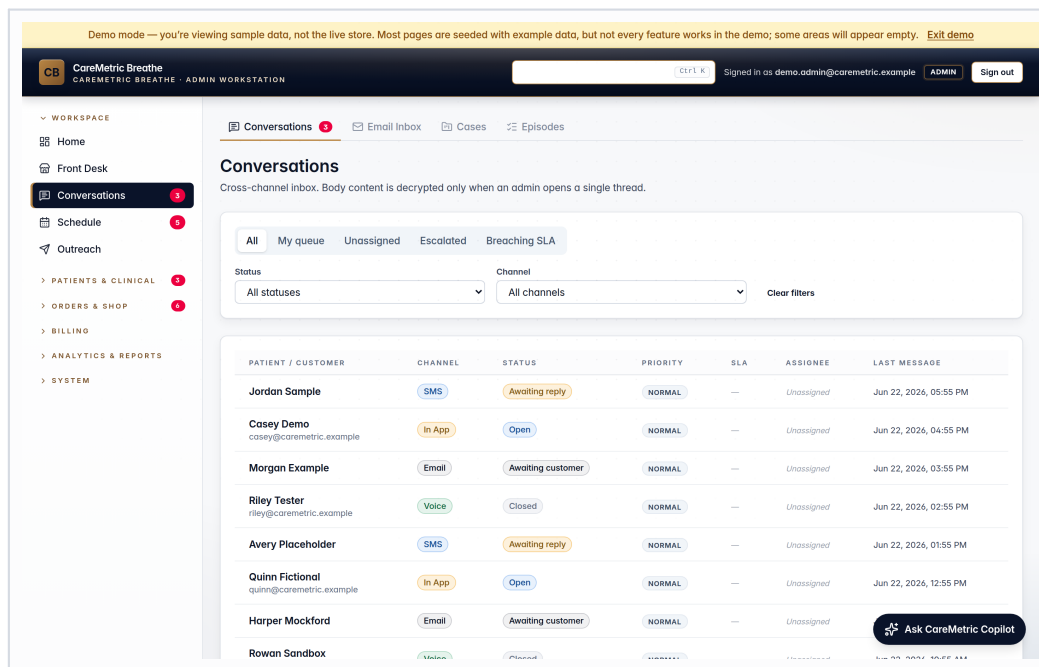

Billing Config. The rule store the whole engine reads: payer profiles, fee schedules (with CMS import), modifier rules, denial-code mappings, claim templates, and HCPCS coverage diagnoses.

Package & Usage. Your CareMetric Breathe subscription plan, optional add-ons, and the current month's usage — useful when planning spend.

CUSTOMER SERVICE REP (CSR)

Customer Service Rep

The patient's first point of contact — messages, orders, scheduling, and day-to-day service.

Conversations — the unified SMS/MMS/email inbox a CSR works all day.

How the resupply engine works, end to end

Resupply is the heart of the business, and it largely runs itself. Here's the machinery behind the reorder cycle.

When reminders go out. An automated job scans hourly for prescriptions that are due and sends a reminder on each patient's cadence — typically the 90- and 30-day reorder windows. The cadence is resolved per patient: an explicit per-patient override wins, then frequency rules matched by product, payer, and how long the patient has been on service, then the prescription's own interval. Device-reported supply schedules from the therapy-cloud sync feed the next-eligible dates, so reminders track real wear, not just the calendar.

One tap for the patient. Reminders go by SMS and email (the AI voice agent can call, too). Email carries signed one-tap **confirm**, **edit**, and **stop** links — no login, no account, no phone tree; SMS simply accepts a reply to confirm or decline. A quiet-period guard skips anyone you've already been talking to in the last 48 hours, and one reminder goes out per patient per cycle even if several items are due.

Why it lifts reorders. Because outreach fires automatically on the payer-allowed cadence across every channel, eligible patients are reliably reminded instead of forgotten — and a confirmation takes one tap, so more of them say yes. A confirmed reorder flows straight through the funnel — **due** → **reminded** → **confirmed** → **shipped** — into fulfillment and billing with no re-keying, and you can watch the conversion at each step, per channel, on the Reorder Reminders board.

Effortless for the customer. No app to download, no portal to remember: tap to confirm, change, or stop right from the text or email. Patients who'd rather not think about it subscribe once and let auto-ship keep supplies arriving on the cadence their insurance allows.

■ Paperless paperwork — e-signature, nothing printed

Everything a patient or provider needs to sign is signed on a screen. No printing, no scanning, no faxing, no lost forms, no delays.

Sign on a phone, file automatically. Staff stage a document or a packet; the patient gets a link and e-signs on their own device with a typed name and explicit ESIGN consent — image-free and ESIGN-Act compliant. The signed PDF files itself to the chart the moment it's done, and any related **bill hold** lifts automatically so the claim can go out. Nothing is printed, nothing gets lost, and nothing waits on the mail.

Included document templates. Ready-to-send templates ship with the system:

- Standard Written Order (SWO) — PAP device & supplies
- PAP Certificate of Medical Necessity (CMN)
- Structured CMN forms — CMS-484 (oxygen), CMS-846 (compression), CMS-848 (TENS)
- DWO / CMN renewal forms by HCPCS family (PAP, RAD, oxygen, ...)
- ABN (CMS-R-131) with Options 1–3
- Assignment of Benefits & financial responsibility
- DMEPOS Supplier Standards notice
- Proof of Delivery
- Refill Confirmation
- New-patient setup packet (ABN + Supplier Standards + AOB, sent as one)

Plus free-form manual documents (prescription, agreement, delivery ticket, cover letter) and documentation packets (prior-auth support, appeal support, accreditation audit, medical-records request).

■ The provider portal — providers e-sign and see their patients

A secure portal that ends the fax-and-chase cycle with referring physicians.

Providers e-sign — no more faxing. Invite a referring provider (by NPI, verified against NPPES) into a secure, MFA-protected portal. Stage their CMNs, DWOs, prescription packets, and claims for signature, and the provider signs on their own device — instead of receiving a fax, printing it, signing, and faxing it back (and you chasing what never comes). Every signature is captured in a tamper-evident, hash-chained audit trail with a printable, ESIGN-compliant certificate you can hand a payer.

Providers see their patients. In the same portal a provider can view their patients' active orders and prescriptions and read their therapy data and reports (read-only) — so they can confirm adherence and close the loop without a phone call to your office.

Lifecycle & security. Each document moves pending → signed → ready-to-print / returned-signed / attached-to-chart / released, so staff always know where it stands. Multi-factor authentication is mandatory for every provider, and the portal is off by default — an Owner enables it per tenant in the Control Center.

■ Your daily workspace

Where a CSR lives all day — the inbox and the work queues.

Home. The shared worklist and live counters. As a CSR you'll watch conversations awaiting reply, overdue follow-ups, and returns to action.

Conversations. The unified inbox for inbound SMS, MMS, and email across every patient. Triage threads, claim one for yourself, reply (optionally with a canned reply), tag, snooze, and escalate to a case. Smart routing and required-skills keep threads with the right people.

Email Inbox. Inbound patient email split into “needs response” and “already answered.” When the AI email auto-reply feature is on, high-confidence answers can be drafted or sent automatically; anything account-, order-, or clinically-specific falls through to a human.

Cases. Multi-channel tickets that bind together the conversations, orders, faxes, and documents belonging to one issue, so a complex problem stays tracked end to end.

Episodes. Dated service promises — “we'll call Tuesday,” “awaiting the sleep study” — that keep open commitments from slipping.

■ Schedule & outreach

Plan the day and reach patients at scale or one at a time.

Company Calendar. The shared team schedule of patient appointments — fittings, equipment setups, follow-ups, and video visits — with office hours and closures respected.

Video Visits. Run telehealth visits for setups and mask troubleshooting; the system generates a secure join link and sends it by SMS/email.

Follow-ups. Today's callback queue across customers and patients, with overdue items surfaced so nothing is forgotten.

Bulk Campaigns. Build an audience with filters, sanity-check the recipient count, draft the message, and send a batch SMS or email.

Alert Library & Reminders. Send a curated one-off alert (SMS/email/call) to an individual patient, and manage the automated resupply reminder schedule.

Playbooks, Canned Replies & Automated Messages. Reusable situation-based outreach cadences, saved snippets you drop into manual replies, and the editable copy behind system-sent messages (order confirmations, tracking).

■ Patients & paperwork

The patient record and the documents that surround care.

Patients. Search the roster and open a record for the 360° timeline — every order, message, document, therapy reading, and billing event in one place. Edit demographics and notes.

Duplicate Review. Find likely-duplicate patient records and merge them so a patient's history isn't split across two charts.

Documents & Document Packets. Draft a CMN, prescription, agreement, or fax cover by hand, then send and track an e-signature packet for new-patient onboarding.

Awaiting Signatures & Inbound Faxes. Track documents out for provider signature and scan returned faxes to file them; triage the inbound-fax queue (sleep studies, Rx renewals, chart notes).

Referral Reviewer & Sources. Review AI-extracted intake from faxed/uploaded referral packets and accept them into a new patient record; the Sources scorecard ranks referring physicians by volume and revenue.

■ Orders, catalog & leads

Fulfillment, stock, and the acquisition funnel.

Fit Requests. The queue a finished mask fitting lands in. The patient never files their own insurance order — they send their details or ask to be called, and a CSR verifies the benefit and places the order. Closing a row records what actually happened; only **Fulfilled** — the patient has the mask — marks the fitting as dispensed for the outcomes dashboard.

Orders. Work insurance orders — fulfill, look up, and track — from a single queue.

Shipping Labels. Print shipping labels with the patient's address merged in; tracking numbers auto-fill back onto the order.

Catalog. The SKU registry: what you dispense and how many are on the shelf. Stock only moves as a recorded movement with a reason — received, returned, counted, adjusted — so every balance has a history behind it, and a blank count means **untracked** rather than zero. A dispense is recorded when a fulfillment is queued; an un-catalogued SKU is logged and skipped rather than failing a resupply the patient is due. Low-stock SKUs are badged here and emailed as a digest every six hours.

Backorders. Mark a SKU out of stock and set the substitution rules that apply while it is. This is read by the insurance fulfillment path, not a retail shelf notice, so an uncleared backorder keeps routing patients away from that SKU. Recording a receipt on Catalog clears it automatically.

Insurance Leads. Work new benefit-verification requests that came in from the storefront.

Fitter Invites & Prospects. Invite a patient to the AI mask fitter and review the returned mask & size recommendation; the Prospects view tracks the fitter conversion funnel.

RESPIRATORY THERAPIST (RT)

Respiratory Therapist

Watch therapy, keep patients adherent, and document the clinical care that backs every claim.

[Ask CareMetric Copilot](#)

RT Overview — the therapy board with per-patient AHI, leak, and usage alerts.

Therapy data from every cloud, one login

Manage every patient from one screen no matter whose machine they sleep on — no juggling three vendor portals.

Three manufacturers, one screen. A nightly sync pulls device data from **ResMed AirView**, **Philips Respironics Care Orchestrator**, and **3B Medical React Health** (Luna / iCode). Whatever brand a patient uses, their therapy lands in the same boards and the same patient chart — so an RT works one worklist, not three logins.

What it pulls. For each linked patient the sync brings back device settings (model, serial, therapy mode, pressure min/max, ramp, humidifier, mask type); a compliance summary (days with data, days ≥ 4 hours, average usage and AHI, and the CMS 90/30 flag); recent nights (usage minutes, AHI, leak rate, P95 pressure); and supply items with last-replaced and next-eligible dates that drive resupply timing.

How the sync works. An automated nightly job walks every active therapy link (least-recently-synced first, rate-limited so it's gentle on the vendor APIs), normalizes each vendor's quirks into one common shape, and stores a snapshot. The RT boards read that cache instantly; you can also force a manual refresh for one patient or one source from the patient chart.

■ Alerts, and how compliance is ensured

The platform watches therapy for you and surfaces the patients who need a human.

Clinical alerts to the RT. The Therapy Fleet worklist ranks patients by reason so you work the highest risk first: **setup-adherence risk**, **no recent data**, **high AHI**, **high leak**, and **usage decline**. Mask-fit feedback and open interventions feed the same queue, and clinical outreach is frequency-capped (a minimum gap between touches) so patients aren't over-contacted.

Ensuring CMS 90-day compliance. Setup Adherence tracks every new PAP patient's first 90 days against the Medicare standard — ≥ 4 hours on ≥ 21 nights within any rolling 30-day window — and classifies each as qualified, on-track, or at-risk, with the best rolling count, nights still needed, and days remaining. At-risk patients surface early so you can coach them before the window closes and the rental fails to convert.

Alerts and messages to the customer. The Alert Library sends curated one-off email, SMS, or voice alerts to a patient (with safe variable substitution), and resupply reminders nudge them on cadence. Optional enforcement can hold a too-soon or coverage-blocked reorder and route it to a CSR as an alert instead of letting it ship.

■ Therapy monitoring

Population boards that surface who needs attention, fed by the therapy-cloud integrations.

RT Overview. The at-a-glance therapy board: per-patient alerts with AHI, mask leak, and usage metrics, so you can spot a struggling patient fast.

Therapy Fleet. Population compliance cohorts and the clinical outreach worklist — slice the patient base by how they're doing and act on the cohort that needs you.

Setup Adherence. The CMS 90-day adherence tracker for new Medicare setups (the ≥ 4 hours on $\geq 70\%$ of nights compliance window), so a setup never quietly fails its window.

Resupply Opportunities. Device-reported supplies that are due for replacement, which feed resupply orders.

RT Outcomes. Per-therapist activity — encounters logged, patients touched, interventions opened — for visibility into clinical workload and impact.

■ Clinical work

Document care and drive non-adherent patients back on track.

Clinical Encounters. The clinical documentation store: record an encounter with reason, assessment, intervention, and plan, or just a free-text note. The patient's clinical timeline is built from these.

Interventions. A structured worklist for non-adherent patients — capture the cause, the plan, and the outcome, and track it to resolution.

Mask-fit Feedback. Triage patients who report a leaking or uncomfortable fit and route them to a follow-up or refit.

Clinical Outreach. Send supportive check-ins to patients with an open intervention. Consent- and do-not-disturb-aware so outreach stays appropriate.

Adherence Coaching. Build outreach plans for patients whose CPAP use is slipping, before they fall out of compliance.

Video Library. Curate the short education videos shown to patients on the storefront's learn pages.

■ Providers, devices & reporting

The registry, equipment safety, and provider-ready output.

Providers. The central physician / nurse-practitioner registry, backed by NPPES lookups, used across prescriptions and referrals.

Recalls. The manufacturer recall registry, scanned against your dispensed device serials to flag at-risk patients.

Asset Recovery. Recover machines from discontinued patients so they can be refurbished and redeployed.

Therapy Report. A provider-ready, print-quality adherence snapshot you can generate by provider, patient, or device manufacturer — ideal for closing the loop with referring physicians.

Patient clinical timeline. Inside the patient 360° view, the clinical tab gathers therapy readings, prescriptions, encounters, and resupply history in one chronological story.

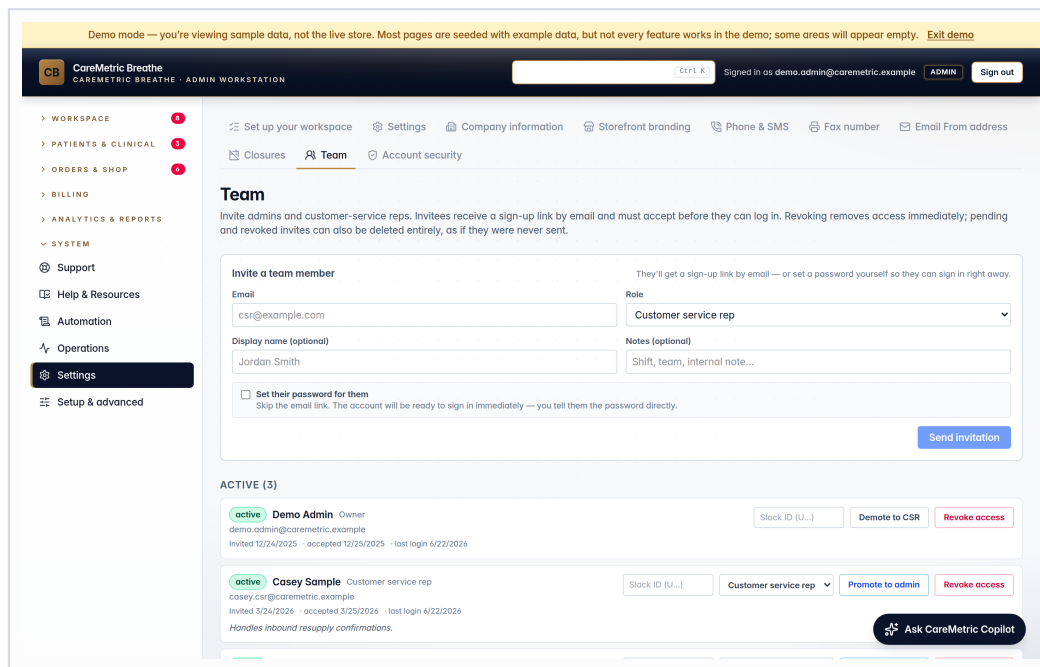

Part 3 — Job Aides by Role

Step-by-step walkthroughs for the highest-value, most common tasks in each role. Navigation paths are shown as **Group** → **Section** → **Page**.

ADMINISTRATOR (OWNER & ADMIN)

Administrator

Job aides — Run the whole practice

The Team page — invite staff and assign a role (Owner, Admin, CSR, Biller, RT).

Create your CareMetric Breathe workspace (self-serve sign-up)

How a brand-new practice gets its own workspace and first Owner login.

- 1 Go to the public site **/breathe** and choose **Create your account (/breathe/signup)**.
- 2 Enter your **company name**, a **work email**, a **password** (at least 12 characters), and pick a **plan** (Virtual Mask Fitter, Launch, Growth, or Scale — Enterprise routes to sales).
- 3 Submit. We provision your organization, copy in your plan's feature-flag bundle, and create your first **Owner** login.
- 4 Open the **verification email** we send and click the link to activate the account (sign-in is blocked until it's verified).
- 5 Sign in at **/admin/sign-in**, confirm payment, then work the setup checklist below.

***Tip** Only the first Owner self-signs-up; every teammate after that is invited from the Team page. (Operators can also pre-provision a workspace from the command line.)*

Sign in and turn on multi-factor authentication

Do this first — every admin account should have MFA.

- 1 Go to **/admin/sign-in** and sign in with your email and password.
- 2 Open **System** → **Account Security**.
- 3 Choose **Add authenticator** and scan the QR code with your phone's authenticator app (Google Authenticator, Authy, 1Password, etc.).
- 4 Enter the 6-digit code to confirm, then save your recovery codes somewhere safe.
- 5 Sign out and back in to confirm the code is requested.

***Tip** If you lose your authenticator, a recovery code or another Owner can restore access — store recovery codes offline.*

Finish the workspace setup checklist

Make the platform run under your own brand, numbers, and payments.

- 1 Open **System** → **Set Up Your Workspace** (or click the “finish setting up” banner on Home).
- 2 Set your brand and logo under **Storefront Branding**, and your legal details under **Company Information**.
- 3 Connect your numbers under **Phone & SMS** and **Fax Number**, and your sender under **Email From Address** (authenticate the sending domain for deliverability).
- 4 Wire up payments (Stripe) so the storefront and patient statements can collect.
- 5 Work down the checklist until every essential step is green.

***Tip** A NULL/unset From address falls back to the platform default — patient email still sends, but your own authenticated domain lands in the inbox instead of spam.*

Invite a team member and assign a role

Add staff and scope their access to exactly what they need.

- 1 Open **System** → **Team** (Owner only).
- 2 In the invite card, enter the person's email and pick a role: **Owner**, **Admin**, **Customer service rep**, **Biller**, or **Respiratory Therapist**.
- 3 Optionally add a display name, a home location, and notes, then send the invite.
- 4 The invitee receives a sign-up link by email and sets their own password before first login.
- 5 To change someone later, use the role selector on their row, or **Revoke** to remove access immediately.

Tip Pick **Biller** for revenue-cycle staff — it unlocks the whole Billing area without exposing CSR tools, clinical notes, or system settings.

Turn a feature on or off

The Control Center is the master switch panel.

- 1 Open **System** → **Setup & Advanced** → **Control Center**.
- 2 Find the feature — voice agent, SMS/email campaigns, claim auto-submit, AI billing, the storefront chatbot, the admin assistant, multi-location, etc.
- 3 Flip the toggle; the change takes effect immediately for everyone.
- 4 For automation that sends messages (e.g. auto-submit), confirm the matching schedule/credentials are configured too.

Tip Use the Bot Playground to rehearse the chatbots before enabling them for real patients.

Connect a therapy-cloud integration

Pull device adherence data from ResMed, Philips, or 3B.

- 1 Open **System** → **Setup & Advanced** → **System Configuration** (Owner only) and enter the vendor credentials.
- 2 Open **System** → **Operations** → **Integrations** to confirm the connection reports *available*.
- 3 Trigger a sync (or wait for the nightly job) and watch the sync status.
- 4 Patient therapy data now flows into the RT Overview and Therapy Fleet boards.

Tip If an integration shows *unavailable*, a credential is missing — re-check System Configuration; the badge never reveals which secret is unset.

Send team alerts to Slack

Bring real-time CS alerts and operator digests into your team's Slack.

- 1 In Slack, create an app/bot and note its **bot token**, **signing secret**, and the **channel** for alerts.
- 2 Open **System** → **Setup & Advanced** → **System Configuration** (Owner only) and enter those values.
- 3 In the **Control Center**, confirm `slack.notifications`, `slack.interactivity`, and `slack.digests` are on (they ship on but stay inert until the credentials exist).
- 4 On the **Team** page, link each teammate's Slack handle so Escalate actions are attributed correctly.
- 5 Post a test event and confirm the alert (with its Escalate button and deep link) lands in your channel.

Tip Slack messages are deliberately non-PHI — a reference, a status, and a link back into the console — never message bodies, phone numbers, or clinical detail.

Check that the plumbing is healthy

A two-minute daily glance at jobs and message delivery.

- 1 Open **System** → **Operations** and confirm the background worker and nightly sync ran without errors.
- 2 Open **Outbound Messages** to scan recent SMS/email delivery results.
- 3 Open **Delivery Failures** and retry or resolve any bounces or shipping exceptions.
- 4 If a partner webhook failed, re-queue it from **Webhook Deliveries**.

Set business goals and KPI alerts

Tell the platform what “good” looks like and let it warn you.

- 1 Open **Analytics & Reports** → **Performance & Goals** → **Goals & Targets** and set a target per KPI and period.
- 2 Open **KPI Alerts** and define the thresholds that should trigger a warning (revenue, denial rate, churn).
- 3 Watch pace-to-goal on the dashboard and act on alerts as they fire.

Ask CareMetric Copilot for help

The fastest way to find a page or learn how something works.

- 1 Click **Ask CareMetric Copilot** on any admin page.
- 2 Type a plain-language question — “where do I turn features on or off?” or “walk me through processing a claim.”
- 3 Follow the clickable links it returns straight to the right page.
- 4 Have an idea for a missing feature? Tell it — after you confirm, it emails a structured suggestion to the owners.

Tip The assistant only explains the app and (with your OK) forwards ideas. It never changes data or shows patient PHI.

Get billing ready for go-live

Stand up the revenue cycle before the first claim.

- 1 Enter clearinghouse credentials (Office Ally; and Da Vinci PAS if used) under **System Configuration**.
- 2 Under **Billing** → **Config**, add your payer profiles, import the CMS DMEPOS fee schedule, and set modifier + denial-code rules.
- 3 Decide automation posture in the Control Center: eligibility pre-check, auto-re-verify, claim auto-submit, AI billing — start manual, then enable as you trust it.
- 4 Validate against Office Ally's test (T) cycle before flipping line-level changes like the ordering-provider loop on live claims.

Tip Run claims through the manual staged-approval path first; turn on the auto-submit cron once a few clean batches have gone out.

Connect PacWare (billing/warehouse) sync

Bridge to a legacy PacWare system without an API.

- 1 Open **System** → **Operations** → **PacWare**.
- 2 Import the patient roster CSV — existing patients only have BLANK fields filled, never overwritten.
- 3 Export the patient roster or resupply-due worklist with the verify step (preview the count + sample first).
- 4 Nothing is ever pushed automatically; the opt-in “ready to sync” notice tells staff when an export is worth running.

Run and export a report for the books

Pull the numbers your accountant needs in a couple of clicks.

- 1 Open **Analytics & Reports** → **Reports**.
- 2 Pick the report — revenue summary, patient payments, insurance claims, refunds journal, or the all-financial bundle.
- 3 Set the date range (up to 90 days).
- 4 Export as CSV, PDF, or QuickBooks (Desktop .iif or Online .qbo.csv).

Tip Patient payments and insurance claims are kept separate so cash isn't double-counted across the two.

See who accessed a patient's record

Answer a “who looked at this chart?” question.

- 1 Open **Analytics & Reports** → **Audit Trail** (admins only).
- 2 Filter by employee, by patient, and by time frame to narrow the access events.
- 3 Read the list of who accessed which patient's information, and when.

Tip The Audit Trail is kept out of the CSR and clinician sidebars; only full admins can open it.

Invite a provider to the e-sign portal

End the fax-and-chase cycle with a referring physician.

- 1 Confirm the provider exists under **Patients & Clinical** → **Providers & Recalls** → **Providers** (add them by NPI; NPPES verifies).
- 2 Make sure the provider portal is enabled in the Control Center.
- 3 Invite the provider from the E-signature Portal — they get a set-password link and must enroll MFA.
- 4 Stage their documents for signature; they sign on their device and you track each through to released/attached.

Tip Providers can also view their patients' therapy and reports in the portal — read-only, no PHI leaves your control.

*The Prior Auths worklist — at-risk SLAs and auths expiring soon.***Verify a patient's insurance (270/271)**

Confirm coverage before you bill.

- 1 Open **Billing** → **Worklists** → **Verify Insurance**.
- 2 Enter the patient and plan details (or pick an existing patient).
- 3 Run the check; the 271 response shows active/inactive status and plan details.
- 4 If coverage is unknown, use **Insurance Discovery** to find it from demographics instead.

Tip** Work the system-wide **Eligibility** worklist regularly — rejected and inactive coverage floats to the top.Submit a prior authorization**

Secure the auth before the claim goes out.

- 1 Open **Billing** → **Worklists** → **Prior Auths**.
- 2 Pick a draft (or a claim flagged as needing auth) and open the request form.
- 3 Complete the clinical justification and attach the supporting documentation.
- 4 Submit electronically via Da Vinci PAS where the payer supports it; otherwise follow the payer's channel.
- 5 Track the status and watch the "expiring soon" list so an auth never lapses mid-therapy.

Submit claims through the clearinghouse

Get clean claims out the door.

- 1 Open **Billing** → **Worklists** → **Auto-submit** to see claims that are preflight-clean with active eligibility.
- 2 Review the batch and approve it to transmit — or let the scheduled cron send it automatically.
- 3 Open **Billing** → **Tools** → **Office Ally** to watch 837P submissions and acknowledgements (999/277CA).
- 4 For a one-off or corrected claim, use **Manual Claim** instead.

***Tip** The auto-submit cron only fires when BOTH the schedule and the Control Center flag are on — ask an admin if it's quiet.*

Post an ERA (835 remittance)

Auto-post payer payments and surface denials.

- 1 Open **Billing** → **Tools** → **ERA Files**.
- 2 Upload the 835 file from the payer/clearinghouse.
- 3 The system matches it to claims and posts the adjudications automatically.
- 4 Denied lines flow to the Denials worklist for follow-up.

Work denials and file an appeal

Recover the dollars worth chasing first.

- 1 Open **Billing** → **Worklists** → **Denials Worklist** — it's ranked by recoverable dollars × win-probability.
- 2 Open the top denial; the AI Queue may already suggest the corrected code or edit.
- 3 Fix and resubmit, or start an appeal with the supporting documentation.
- 4 Track the appeal to resolution.

***Tip** Check **Denials & DSO** periodically to spot a payer whose denial rate is trending up.*

Work A/R aging and timely filing

Don't let claims age out or miss the filing window.

- 1 Open **Billing** → **A/R & collections** → **A/R Aging** and work the oldest buckets and worst payers first.
- 2 Open **Filing Deadlines** and clear anything close to its timely-filing cutoff immediately.
- 3 Roll any primary balances to secondary payers from **Secondary Claims**.

Send a patient statement

Collect the patient-responsibility balance.

- 1 Open **Billing** → **A/R & collections** → **Statement Send**.
- 2 Review the patient-responsibility amounts due.
- 3 Send by email or SMS — the system respects consent and quiet hours automatically.
- 4 Use a payment link so the patient can pay online.

Configure a payer profile and fee schedule

Set the rules the claim engine reads.

- 1 Open **Billing** → **Tools** → **Config**.
- 2 Add or edit the payer profile (IDs, addresses, claim format).
- 3 Import or enter the fee schedule (CMS import is available), modifier rules, and denial-code mappings.
- 4 Map HCPCS coverage diagnoses so claims build with the right codes.

Tip Fee-schedule and clearinghouse setup is usually a one-time job with an admin — once it's right, the worklists run smoothly.

Quick-verify a patient's coverage from their chart

The one-click check you'll use most.

- 1 Open the patient (**Patients & Clinical** → **Patients**) or their billing tab.
- 2 Click **Verify insurance** in the quick-actions card.
- 3 Read the 271 result inline — active/inactive, plan, copay/deductible — or the “queued” note if the payer answers by deferred file.
- 4 The result is saved to the patient's eligibility history for the next biller.

Tip Same button lives on the eligibility worklist and a standalone cross-patient verifier (Billing → Verify Insurance) for bulk checks.

Find unknown coverage with Insurance Discovery

Turn “we don't know who covers them” into a billable claim.

- 1 Open **Billing** → **Worklists** → **Insurance Discovery**.
- 2 Enter the patient's demographics (name, DOB, ZIP; optional SSN / member-id hint).
- 3 Run the search; review the active coverages the payer network returns.
- 4 Attach the right coverage to the patient and proceed to verify/bill.

Tip Insurance Discovery is a paid clearinghouse add-on — if it's greyed out, an Owner enables it in the Control Center for your tenant.

Work the AI Queue

Let the assistant tee up the highest-payoff claims.

- 1 Open **Billing** → **Worklists** → **AI Queue**.
- 2 **Blocking** drafts need your input — open, fix the flagged issue, re-scrub.
- 3 **Fixable** drafts come with suggested patches — review and apply with one click.
- 4 **Needs analysis** denials — run the denial analyzer to get root cause + fix steps.
- 5 **Auto-resubmit ready** — the fix is safe and high-confidence; approve the one-click resubmit.

Tip The AI never changes a claim without you approving the patch; PHI is minimized before anything reaches the model.

Advance a capped-rental cycle

Keep Medicare CPAP rentals billing on schedule with the right modifiers.

- 1 Open **Billing** → **A/R & collections** → **Capped Rentals**.
- 2 Review the cycles due for their next rental month.
- 3 Confirm the auto-generated monthly claim — the modifier is already rotated (KH months 1–3, KI from month 4, plus KX once 90-day compliance is met).
- 4 Submit it with the rest of your batch.

Tip Compliance (≥ 4 hrs on $\geq 70\%$ of nights) is read from the therapy-cloud sync, so the KX modifier is applied only when the data supports it.

Generate and submit a secondary (COB) claim

Collect the balance the primary left behind.

- 1 After a primary pays (via ERA), open **Billing** → **A/R & collections** → **Secondary Claims**.
- 2 Open the auto-drafted secondary — the COB amounts (paid, contractual, patient responsibility) are already snapshotted from the primary's 835.
- 3 Review the secondary payer and line amounts, then submit.
- 4 If auto-draft is off for your tenant, use the COB-eligible worklist to create it.

Tip Secondary claims are never auto-submitted — they always wait for a biller to review.

Clear a bill hold

Release a claim once its paperwork is back.

- 1 A claim with outstanding REQUIRED paperwork (Rx, SWO/DWO, CMN, AOB, ABN, proof of delivery) is held from submission.
- 2 Open the claim or **Billing** → **Worklists** → **Bill Hold** to see what's missing.
- 3 Mark the requirement satisfied — or it clears itself when the patient e-signs, you upload the doc, or an inbound fax auto-matches it.
- 4 The hold lifts automatically when the last requirement is met; the claim joins the next batch.

Work the patient collections ladder

Escalate unpaid balances without dunning anyone who has already paid.

- 1 Open **Billing** → **A/R & collections** → **Collections**.
- 2 Each unpaid balance sits on a dunning rung — statement → reminder → second notice → final notice → agency — and advances on its cadence automatically.
- 3 Batch-print the final-notice letters as one PDF for the accounts that have reached that rung.
- 4 For accounts that reach the agency step, export the agency-eligible list (a reviewed, deliberate action) to place with your collections partner.

Tip The ladder pauses the instant a balance is paid or the patient goes on a payment plan, so settled patients are never dunned. Requires the `collections.dunning_flag` (and `collections.agency_export` for the hand-off) — an Owner enables them in the Control Center.

Respond to a Medicare ADR (audit request)

Answer an Additional Documentation Request before its deadline.

- 1 Open **Billing** → **A/R & collections** → **ADR / Audit Response** — open requests are ranked by response deadline.
- 2 Open the request and work its checklist of the documents the payer/contractor wants.
- 3 Use **Build audit packet** to assemble the SWO, CMN, sleep study, compliance summary, proof of delivery, and notes into one PDF, then submit it.
- 4 Record the outcome (won/lost) so your audit win-rate is tracked.

Tip Requires the `billing.adr_queue` flag (an Owner enables it in the Control Center); a nightly sweep surfaces at-risk and overdue deadlines.

CUSTOMER SERVICE REP (CSR)

Customer Service Rep

Ask CareMetric Copilot

Fit Requests — finished fittings waiting for an order.

Handle an inbound message

Triage and reply in the unified inbox.

- 1 Open **Workspace** → **Conversations** and pick a thread awaiting reply (or claim one for yourself).
- 2 Read the patient's history in the side panel for context.
- 3 Reply directly, or insert a **Canned Reply** for a common answer.
- 4 Tag or snooze the thread, or promote it to a **Case** if it spans multiple channels.
- 5 If it needs a specialist, assign it or escalate.

Tip Order-, account-, and clinical-specific questions should go to the right person — use **Cases** so the full history travels with the issue.

Work a fit request

Turn a finished mask fitting into an order.

- 1 Open **Orders, Catalog & Leads** → **Fit Requests** — oldest first; the patient was told one business day.
- 2 Read what they asked for: they either sent their details or asked to be called.
- 3 Verify the benefit properly — whatever the patient typed is a starting point, not a verified plan.
- 4 Place the order and move the row through Contacted → In progress.
- 5 Close it with the real outcome. Only **Fulfilled** means the patient has the mask.

Tip Never close a row as Fulfilled to tidy the queue — it inflates your dispense rate and tells the outcomes dashboard a mask arrived that never did.

Look up a patient and read the 360° timeline

Everything about a patient in one place.

- 1 Open **Patients & Clinical** → **Patients** and search by name or phone.
- 2 Open the record to see the unified timeline — orders, messages, documents, therapy, and billing.
- 3 Edit demographics or add a note as needed.
- 4 If you find a duplicate, flag it in **Duplicate Review** to merge the charts.

Send a bulk SMS or email campaign

Reach a filtered audience at once.

- 1 Open **Workspace** → **Outreach** → **Bulk Campaigns**.
- 2 Build the audience with filters and check the resolved recipient count.
- 3 Draft the message (or start from a Playbook).
- 4 Review and send; track delivery under **Outbound Messages**.

Tip Always sanity-check the recipient count before sending — it's the cheapest way to avoid an embarrassing mass message.

Schedule a follow-up or video visit

Put the next touch on the calendar.

- 1 Open **Workspace** → **Schedule** → **Company Calendar**.
- 2 Create an appointment (fitting, setup, follow-up) on the right day, respecting office hours.
- 3 For telehealth, create a **Video Visit** — the join link is sent to the patient by SMS/email.
- 4 Track the callback queue under **Follow-ups**.

Process a return or RMA

Decide a return and close it out.

- 1 Open **Orders & Shop** → **Orders** → **Returns & RMAs**.
- 2 Open the return request and review the reason and comfort-guarantee window.
- 3 Approve or deny; on approval, choose restock and/or refund.
- 4 The patient is notified automatically of the decision.

Fulfill and ship an order

Get product out the door with tracking.

- 1 Open **Orders & Shop** → **Orders** and pick the order to fulfill.
- 2 Open **Shipping Labels** and print the label — the patient address is merged in automatically.
- 3 The tracking number flows back onto the order and the patient is notified.

Send an e-signature document packet

Get new-patient paperwork signed.

- 1 Open **Patients & Clinical** → **Documents & e-sign** → **Document Packets**.
- 2 Choose the patient and the packet template (CMN, prescription, agreement).
- 3 Send for e-signature; track progress under **Awaiting Signatures**.
- 4 Returned faxes can be scanned in and filed against the patient.

Triage an inbound fax or referral

Turn a faxed referral into a patient.

- 1 Open **Patients & Clinical** → **Documents & e-sign** → **Inbound Faxes** and review the queue.
- 2 For a referral packet, open **Referral Reviewer** — the AI has already extracted the intake fields.
- 3 Verify the demographics and insurance, then accept it into a new patient record.
- 4 Attribute the referral to its source so the physician scorecard stays accurate.

Invite a patient to the AI mask fitter

Let a patient size their mask from a selfie.

- 1 Open **Orders & Shop** → **Storefront & Leads** → **Fitter Invites**.
- 2 Enter the patient and send the invite link.
- 3 When they finish, review the returned mask and size recommendation.
- 4 Convert it to an order, or follow up from the Prospects funnel.

Reply to a patient email (with AI assist)

Work the email side of the inbox.

- 1 Open **Workspace** → **Email Inbox** and pick a thread in “needs response.”
- 2 If AI auto-reply is on, a high-confidence draft may already be proposed — review and send, or edit first.
- 3 For anything order-, account-, or clinically-specific, write the reply yourself or escalate to a case.
- 4 Sent threads move to “already answered.”

Tip AI auto-reply only sends on its own above a confidence bar; everything else falls to a human by design.

Work an insurance lead

Follow up someone who asked what their plan covers.

- 1 Open **Orders, Catalog & Leads** → **Insurance Leads**.
- 2 Review what they asked for and their contact details.
- 3 Run the benefit check, then call or message them with what you found.
- 4 Convert them into a patient record when they want to proceed.

Keep stock straight after a count

Make the shelf and the system agree.

- 1 Open **Orders, Catalog & Leads** → **Catalog**.
- 2 Find the SKU and record the difference as a **counted** movement — never type over the total.
- 3 Give the movement a reason while you still remember it; that is what explains the variance later.
- 4 Recording a receipt also clears any backorder on that SKU automatically.

Tip A blank count means untracked, not zero — an untracked SKU never warns you that it has run out.

RESPIRATORY THERAPIST (RT)

Respiratory Therapist

Watch therapy, keep patients adherent, and document the clinical care that backs every claim.

Clinical Encounters — document the care you provided.

Review the therapy board and spot at-risk patients

Your daily clinical triage.

- 1 Open **Patients & Clinical** → **Therapy Monitoring** → **RT Overview**.
- 2 Scan the alerts — high AHI, high mask leak, low usage — sorted by severity.
- 3 Open a flagged patient to see their therapy detail.
- 4 Use **Therapy Fleet** to work a whole compliance cohort at once.

Tip Therapy data is only as fresh as the integration sync — if a board looks empty, ask an admin to check Integrations.

Document a clinical encounter

Capture the care you provided.

- 1 Open the patient's record, or **Patients & Clinical** → **Clinical Work** → **Clinical Encounters**.
- 2 Start a new encounter and choose its type (mask fit, troubleshoot, setup education, adherence intervention, phone, other).
- 3 Record the reason, assessment, intervention, and plan — or just a free-text note.
- 4 Set a follow-up date if one is needed, then save.

***Tip** Encounters build the patient's clinical timeline and back up the medical necessity behind claims — document while it's fresh.*

Open and work a non-adherence intervention

Get a slipping patient back on therapy.

- 1 Open **Patients & Clinical** → **Clinical Work** → **Interventions**.
- 2 Open the patient (or create an intervention from an RT Overview alert).
- 3 Record the cause of non-adherence and the plan.
- 4 Reach out via **Clinical Outreach** (consent/DND-aware), then log the outcome.
- 5 Track it to resolution.

Track CMS 90-day setup adherence

Make sure new Medicare setups clear their compliance window.

- 1 Open **Patients & Clinical** → **Therapy Monitoring** → **Setup Adherence**.
- 2 Review each new setup's progress toward ≥ 4 hours on $\geq 70\%$ of nights within the 90-day window.
- 3 For anyone trending short, open an intervention and coach early.
- 4 Confirm passing patients before the window closes.

Work the resupply-due worklist

Catch supplies that need replacing.

- 1 Open **Patients & Clinical** → **Therapy Monitoring** → **Resupply Opportunities**.
- 2 Review device-reported supplies that are due.
- 3 Confirm the patient's needs and hand off to resupply ordering.
- 4 Reorder reminders can carry the rest automatically.

Triage mask-fit feedback

Fix leaks and discomfort before they cause drop-off.

- 1 Open **Patients & Clinical** → **Clinical Work** → **Mask-fit Feedback**.
- 2 Open a patient reporting a leaking or uncomfortable fit.
- 3 Decide on a refit or follow-up and act on it.
- 4 Document the encounter and outcome.

Generate a provider-ready therapy report

Close the loop with the referring physician.

- 1 Open **Analytics & Reports** → **Clinical & Customer** → **Therapy Report**.
- 2 Choose the scope — by provider, patient, or device manufacturer.
- 3 Generate the print-quality adherence snapshot.
- 4 Send or print it for the physician's chart.

Check equipment recalls

Protect patients on recalled devices.

- 1 Open **Patients & Clinical** → **Providers & Recalls** → **Recalls**.
- 2 Review the manufacturer recall registry.
- 3 The system scans recalls against your dispensed serials and flags at-risk patients.
- 4 Reach out to affected patients and arrange a remedy.

Request or renew a prescription

Keep orders billable with current paperwork.

- 1 From the patient chart or **Patients & Clinical** → **Providers & Recalls** → **Providers**, find the ordering provider.
- 2 Start a prescription / renewal request and stage the document.
- 3 Send it for the provider's e-signature (or fax it) and track it under Awaiting Signatures.
- 4 Once signed, it files to the chart and lifts any related bill hold.

Run a population outreach from a compliance cohort

Act on a whole at-risk group at once.

- 1 Open **Patients & Clinical** → **Therapy Monitoring** → **Therapy Fleet**.
- 2 Pick the cohort that needs attention (e.g. low-usage, leak, or slipping adherence).
- 3 Launch consent/DND-aware Clinical Outreach to the cohort.
- 4 Track responses and open interventions for those who need a closer touch.

Frequently Asked Questions

Quick answers, grouped by area. For step-by-step instructions see the job aides in Part 3; for the full detail see Part 2.

Getting started & signing up

Q How does a new practice sign up?

Go to the public CareMetric Breathe site (/breathe) and choose Create your account. Enter your company name, work email, a 12-character password, and a plan; that provisions your workspace and your first Owner login. Verify the emailed link, then sign in at /admin/sign-in and finish setup.

Q Do my staff each sign up too?

No — only the practice's first Owner self-signs-up. Everyone else is invited from the Team page and sets their own password from the invite link. Public self-signup is for patients creating their own account and for new tenants, not staff.

Q Why didn't I get an error when I mistyped my email?

For security the sign-up and sign-in pages never reveal whether an address is on file — they always say “check your email.” If nothing arrives, re-check the address and try again. (Inline checks still catch an obviously malformed email or a password that's too short before you submit.)

Q Can I start texting patients before I have my own phone number?

Yes — until you provision your own number, texts and calls go out on a shared platform number and a patient's reply routes back to you automatically. Provision your own dedicated number under Phone & SMS when you want messages to come from your own line.

Q I don't have a logo yet — what shows on my storefront?

Generate a one-click starter monogram from your storefront name under Storefront Branding; it's created in your browser so nothing shows blank while you source real artwork. A brand-new, unconfigured tenant otherwise shows neutral CareMetric branding, never another tenant's brand.

Q What's the fastest way to turn on the right features for my plan?

The Control Center has a one-click “Apply recommended preset” that sets your feature flags to the bundle for your billing plan. New tenants already start on it; re-apply it after changing plans, then fine-tune any individual flag.

Customer care

Q Where do patient messages go?

SMS, MMS, and email — plus AI call summaries — all land in one unified Conversations inbox. CSRs triage, claim a thread, reply (with canned replies), tag, snooze, and escalate to a Case, so nothing is scattered across separate tools.

Q What can the chatbot handle without a person?

The CareMetric Assistant answers therapy, mask, resupply, and insurance questions 24/7, and for signed-in patients it covers order status, tracking, subscriptions, device info, and returns — handing off to a CSR for anything order-specific, clinical, or actionable.

Q How do we make sure a promise to a patient isn't forgotten?

Use Episodes for dated service promises and Follow-ups for the callback queue; overdue items surface on the Home dashboard.

Q Can we run telehealth visits?

Yes — Video Visits generate a secure join link sent by SMS or email for setups and mask troubleshooting.

Q How do we message many patients at once?

Bulk Campaigns — build an audience with filters, sanity-check the recipient count, and send a batch SMS or email. The Alert Library handles curated one-off alerts.

Q How does a patient use the AI mask fitter?

The fitter is invitation-only. Staff send the patient a signed link by text or email from Orders & Shop → Fitter Invites; the patient opens it, runs the camera-based fitting in their browser, and the completed result attaches back to their chart (or waits in a holding area for staff to attach). The public storefront's "get fitted" button routes to an invitation-required explainer rather than the fitter.

Q Can patients buy anything from us directly?

No. The platform is insurance-only: patients are supplied against their plan and are never charged a card, so there is no cart, no checkout, and no membership to buy. Whatever their plan leaves them owing appears on their billing page, and your billing team collects it. Cash-pay memberships and card-on-file were retired.

Q Do post-purchase review requests go out automatically?

They can. The review request can always be sent on demand from the Reviews worklist ("Send due"), and once the automatic sweep is enabled it goes out on its own about two weeks after delivery — one request per order, only to customers who haven't opted out.

Q Can a returned item go back into inventory?

Optionally. When you mark a return received you can choose to restock it, which adds the quantities back to tracked stock. It's off by default because most DME consumables (opened masks and supplies) aren't resaleable — so you opt in only for genuinely resaleable items.

Billing & revenue cycle

Q Is insurance checked before we bill?

Yes. Eligibility runs by real-time 270/271 on a schedule and again in the seconds before a claim transmits; inactive or prior-auth-required coverage is held back so claims don't bounce.

Q How are only clean claims submitted?

Every claim is scrubbed — structurally and by AI — before submission (modifiers for the rental month, quantity vs. LCD limits, HCPCS/diagnosis match, fee-schedule drift). Problems are flagged or fixed first, lifting your first-pass acceptance rate.

Q What happens when a claim is denied?

The AI denial analyzer reads the CARC/RARC codes, finds the root cause, populates the corrective patch, and — when it's safe and high-confidence — resubmits in one click. The worklist is ranked by recoverable dollars.

Q How do payer payments get posted?

Upload the 835 ERA file and the system auto-posts allowed, paid, and patient-responsibility amounts at the claim and line level, flags denials for follow-up, and is idempotent if a file is re-posted.

Q Does it handle capped rentals and secondary claims?

Yes — capped-rental cycles auto-advance each month with the correct KH/KI/KX modifier rotation, and a secondary / COB claim auto-drafts after the primary pays (you review before submitting).

Q What if a patient's insurance is unknown?

Insurance Discovery searches the payer network from the patient's demographics to find active coverage (a paid clearinghouse add-on).

Q Can we bill on day one?

Yes — the platform ships with 100+ fully-configured payer profiles (the whole Pennsylvania DME market plus the national carriers, Medicare, Medicaid, federal, and workers'-comp/auto programs), each with electronic IDs, claim format, timely-filing window, prior-auth rules, and claims address pre-filled. Adding a payer for another region takes a minute under Billing → Config → Payers.

Reporting & analytics

Q What reports can I run?

Revenue summary, orders, patient payments, insurance claims, refunds journal, returns, customer activity, and an all-financial bundle — over any date range up to 90 days.

Q Can I export to QuickBooks?

Yes — CSV and printable PDF, plus QuickBooks Desktop (.iif) and QuickBooks Online (.qbo.csv).

Q How do I know if I'm hitting my numbers?

Set a target per KPI in Goals & Targets and let KPI Alerts flag any metric that crosses a threshold. Financial analytics (margin & COGS, payer profitability, LTV:CAC) show where money is made and lost.

Q Is patient PHI in the reports?

PHI is minimized — storefront reports hash customer IDs and the customer-activity report is counts only.

Integrations (device clouds)

Q Which manufacturer clouds connect?

ResMed AirView, Philips Respironics Care Orchestrator, and 3B Medical React Health (Luna / iCode).

Q Do I have to log into each vendor portal?

No — a nightly sync pulls all three into one view, so you manage every patient from a single login regardless of device brand.

Q What data comes back?

Device settings, a compliance summary (days ≥ 4 hours, average usage and AHI, the CMS 90/30 flag), recent nights (usage, AHI, leak, pressure), and supply eligibility dates that drive resupply timing.

Q How current is the data?

A nightly job refreshes every active link (rate-limited so it's gentle on the vendor APIs); you can also force a manual refresh per patient or per source.

Re-supply

Q How and when do reorder reminders go out?

An hourly job finds prescriptions due on their cadence — typically the 90- and 30-day windows, tuned per patient and by frequency rules — and sends SMS or email. The AI voice agent can call, too.

Q How does the patient confirm a reorder?

One tap. Email carries signed confirm / edit / stop links (no login needed) and SMS accepts a reply. A confirmed reorder flows straight to fulfillment and billing.

Q Does it avoid pestering patients?

Yes — a quiet-period guard skips anyone you've talked to in the last 48 hours, and only one reminder goes out per patient per cycle even if several items are due.

Q Can patients set it and forget it?

Yes — they subscribe once and auto-ship keeps supplies arriving on the cadence their insurance allows.

In-person / counter orders

Q Someone walks in wanting a mask — what now?

Create or open their patient record, verify the benefit from Billing → Verify insurance, and raise the order against their plan. There is no counter sale: everything is billed to insurance, so a walk-in follows the same path as any other patient, just faster.

Q Can I print a receipt and a shipping label?

Yes — print a receipt and, if you're shipping it, a label with the patient's address merged in and tracking auto-filled back onto the order.

Q Who is allowed to take counter orders?

Anyone with the orders.create permission — front-line CSRs and up.

Respiratory therapy (RT)

Q How do I find at-risk patients?

RT Overview and Therapy Fleet rank patients by reason — setup-adherence risk, no recent data, high AHI, high leak, usage decline — so you work the highest risk first.

Q How is CMS 90-day compliance tracked?

Setup Adherence measures each new PAP patient against ≥ 4 hours on ≥ 21 nights in any rolling 30-day window and flags at-risk patients early so you can coach them before the window closes.

Q Where do I document care?

Clinical Encounters — capture reason, assessment, intervention, and plan (or a free-text note); it builds the patient's clinical timeline and backs the medical necessity behind claims.

Q Can I reach a whole at-risk group at once?

Yes — launch consent- and do-not-disturb-aware Clinical Outreach to a Therapy Fleet cohort.

Q Can I give a referring provider a report?

Generate a print-quality Therapy Report by provider, patient, or device manufacturer.

Documents, e-signature & provider portal

Q Can the system read a referral for us?

Yes — the Referral Reviewer reads an uploaded or faxed referral in one AI pass and extracts the patient's demographics, insurance, ordered items (with HCPCS), sleep study, referring provider, and diagnoses. It flags anything a clean claim is missing, lets you verify insurance in one click, and — once you accept — creates the patient, attaches the coverage, and files the split documents to the chart.

Q Can we fax straight from the system?

Yes — send prescriptions, CMNs, orders, renewal requests, and appeal letters by eFax right from the document. No fax machine, no separate eFax login, and a failed fax retries in a click.

Q How does a faxed-back signature get filed?

Every document you send for signature carries a barcode. When the signed page is faxed back, the system reads that barcode, files the document to the right patient's chart, marks it returned and signed, and releases any bill-hold waiting on it — automatically. Anything it can't match goes to a triage queue for a person.

Q How do we keep track of signatures we're waiting on?

The Awaiting Signatures dashboard lists everything out for a provider's signature, who has it, and how long it's been outstanding — re-send the stale ones, mark items hand-delivered, or scan a returned barcode to file it instantly.

Q Do patients have to print and mail forms?

No — they e-sign on their own device (typed name + explicit ESIGN consent) and the signed PDF auto-files to the chart. It's ESIGN-Act compliant — nothing printed, nothing lost, no delay.

Q Which document templates are included?

SWO, PAP CMN, CMS-484/846/848, DWO / renewal forms, ABN (CMS-R-131), Assignment of Benefits, DMEPOS Supplier Standards, Proof of Delivery, Refill Confirmation, and a new-patient setup packet — plus free-form manual documents and documentation packets.

Q Can providers sign instead of faxing?

Yes — the provider portal lets a referring provider e-sign CMNs, DWOs, prescriptions, and claims on their device, captured in a tamper-evident audit trail. No more fax-and-chase.

Q Can providers see their patients' therapy?

Yes — read-only therapy data and reports for their own patients, in the same MFA-protected portal.

Roles, access & setup

Q What staff roles are there?

Owner, Admin, Customer Service Rep, Biller, and Respiratory Therapist — assigned on the Team page. A page above your role simply doesn't appear in your navigation.

Q How do I turn a feature on or off?

The Control Center has an immediate on/off toggle for every major feature (voice agent, campaigns, auto-submit, AI billing, the chatbots, multi-location, and more).

Q How do I add a teammate?

Invite them by email on the Team page and pick a role; they set their own password from the link, and admins enroll multi-factor authentication.

Q What has to be set up before go-live?

Brand and domain, phone/SMS/fax numbers, an authenticated email sender, payments, and — for billing — clearinghouse credentials and payer/fee-schedule config. The Setup Guide walks through it.

Q Can the team get alerts in Slack?

Yes — add a Slack bot token + channel under System Configuration and the platform posts real-time CS alerts and operator digests into your channel, with an Escalate button and a slash command to act on them. Messages are non-PHI (a reference, a status, and a deep link back into the console). Link each teammate's Slack handle on the Team page.

Q Can I see who looked at a patient's record?

Yes — the admins-only Audit Trail report (Analytics & Reports → Audit Trail) shows who accessed which patient's information and when, filterable by employee, patient, and time frame.

The AI assistants

Q What's the difference between the Assistant and the Copilot?

CareMetric Assistant is the customer-facing storefront chatbot; CareMetric Copilot is the staff-facing helper inside the admin console. (The Penn tenant calls them PennBot and PennPilot.)

Q Will the Copilot change my data?

No — it explains the app and, only after you confirm, forwards a feature idea to the owners. It never changes data and never shows patient PHI.

Q What happens if the AI vendor is down?

Both assistants degrade gracefully — Claude first, then OpenAI, then a safe offline reply — so the app never breaks because a key is missing.

Appendix

Role & permission matrix

What each role can reach.

● full ◐ partial / Owner-gated ○ none

Area	Admin	Biller	CSR	RT
Home & Workspace	●	◐	●	◐
Conversations / inbox & cases	●	●	●	○
Patients (read / edit)	●	◐	●	◐
Orders, shop & returns	●	○	●	○
Billing & revenue cycle	●	●	○	○
Therapy monitoring & clinical notes	●	○	◐	●
Analytics & financial reports	●	◐	◐	◐
Team management	◐	○	○	○
System configuration & secrets	◐	○	○	○

Administrator combines the Owner and Admin tiers — Owner-only items (Team management, System Configuration) are marked partial because only the Owner role can use them. **Biller** reaches the whole Billing area plus patient billing context and the shared inbox (revenue-cycle staff work patient-balance and benefit threads), but not clinical notes or settings. A practice can grant any combination by assigning the matching role on the Team page.

How it compares

How CareMetric Breathe's (CMB) marquee features line up against the DME/HME platforms a resupply business is most likely to evaluate. A full circle = native, half = partial / add-on / via partner, open = not offered or not core.

CMB = CareMetric Breathe · Brightree = Brightree with its ReSupply module · Niko = NikoHealth · TIMS = TIMS Software.

Patient experience

Feature	CMB	Brightree	Niko	TIMS
AI camera-based mask fitting, in-browser, privacy-first	●	○	○	○
Patient portal: what's due, tracking, statements, e-sign	●	◐	◐	◐
Automated resupply outreach, one-tap confirm (SMS/email)	●	●	◐	◐
Conversational AI voice agent for reorders/check-ins	●	◐	○	○
Patient AI chatbot and sleep coach	●	○	○	○

Clinical & therapy

Feature	CMB	Brightree	Niko	TIMS
Therapy-cloud sync (ResMed, Philips, React Health)	●	●	◐	◐
CMS 90-day setup-adherence tracking	●	●	◐	◐
Clinical intervention, coaching, mask-fit worklists	●	◐	○	○
Inbound fax OCR and document triage	●	●	◐	◐

Revenue cycle

Feature	CMB	Brightree	Niko	TIMS
Clearinghouse claims (837P/835) + real-time eligibility	●	●	●	●
AI claim scrubbing + denial recovery by win-probability	●	◐	◐	○
Electronic prior authorization (Da Vinci PAS)	●	◐	○	○
DME A/R: capped rentals, secondary/COB, timely filing	●	●	●	●
Patient statements, payment plans, payment links	●	●	●	●

Operations & intelligence

Feature	CMB	Brightree	Niko	TIMS
Unified omnichannel inbox (SMS, MMS, email, chat)	●	◐	◐	○
Provider e-signature and e-ordering collaboration	●	◐	◐	○
Analytics: margin, LTV/CAC, payer profitability	●	◐	◐	◐
In-app AI staff assistant + no-code automation rules	●	◐	◐	○

CareMetric Breathe entries reflect the shipped platform described in this manual. Competitor entries summarize publicly available product information and may be delivered via partners or paid add-ons; verify with each vendor before relying on this comparison.

Glossary

270 / 271	The electronic eligibility request (270) and the payer's response (271) that confirm a patient's coverage.
837P	The electronic professional claim file sent to a payer (via the clearinghouse) to request payment.
835 / ERA	The Electronic Remittance Advice — the payer's machine-readable explanation of what it paid, used to auto-post payments.
999 / 277CA	Acknowledgements from the clearinghouse/payer confirming a claim file was received and accepted (or rejected).
AHI	Apnea-Hypopnea Index — events per hour of sleep; a core measure of how well therapy is controlling apnea.
Capped rental	A Medicare payment model where a device is rented over a capped number of months (13 or 36) rather than purchased outright.
CMN / DIF	Certificate of Medical Necessity / DME Information Form — documentation a payer requires to justify the equipment.
COGS	Cost of Goods Sold — the product cost used to compute gross margin.
DSO	Days Sales Outstanding — the average number of days it takes to collect after billing.
HCPCS	The procedure/supply codes used on claims (e.g. the codes for a mask, machine, or filter).
LTV : CAC	Lifetime Value to Customer-Acquisition-Cost ratio — a measure of marketing efficiency.
MFA	Multi-Factor Authentication — a second login factor (authenticator-app code) on top of your password.
NPS	Net Promoter Score — a post-delivery satisfaction measure from patient survey responses.
Prior auth (PAS)	Prior Authorization — payer approval secured before dispensing; Da Vinci PAS is the electronic FHIR standard for it.
Resupply	The recurring replacement of CPAP consumables (masks, cushions, filters, tubing) on a cadence.

Need more? Ask CareMetric Copilot in the app, or reach your practice administrator. Owners can find deployment and operator runbooks in the project documentation.
